

# $\beta\beta$ decay and neutrino mass

*35 isotopes in nature*

Most sensitive neutrino mass measurements  
can be obtained from double-beta decay

$2\nu \beta\beta$  decay: a standard  
process in nuclear physics

$0\nu \beta\beta$  decay: a hypothetical  
process

→  $m_\nu \neq 0$  since helicity  
has to "flip"

→  $\bar{\nu} = \nu$

Most sensitive neutrino mass measurements  
can be obtained from double-beta decay

$2\nu \beta\beta$  decay: a standard  
process in nuclear physics

$0\nu \beta\beta$  decay: a hypothetical  
process

→  $m_\nu \neq 0$  since helicity  
has to "flip"  
→  $\bar{\nu} = \nu$

$$\langle m_\nu \rangle = m_{ee} = \left| \sum_k U_{ek}^2 m_k \right| = \left| \sum_k |U_{ek}|^2 e^{i\alpha_{ek}} m_k \right|$$

Each is  $\pm 1$  if CP conserved, but there  
can still be cancellations

Most sensitive neutrino mass measurements  
can be obtained from double-beta decay

$2\nu \beta\beta$  decay: a standard  
process in nuclear physics

$0\nu \beta\beta$  decay: a hypothetical  
process

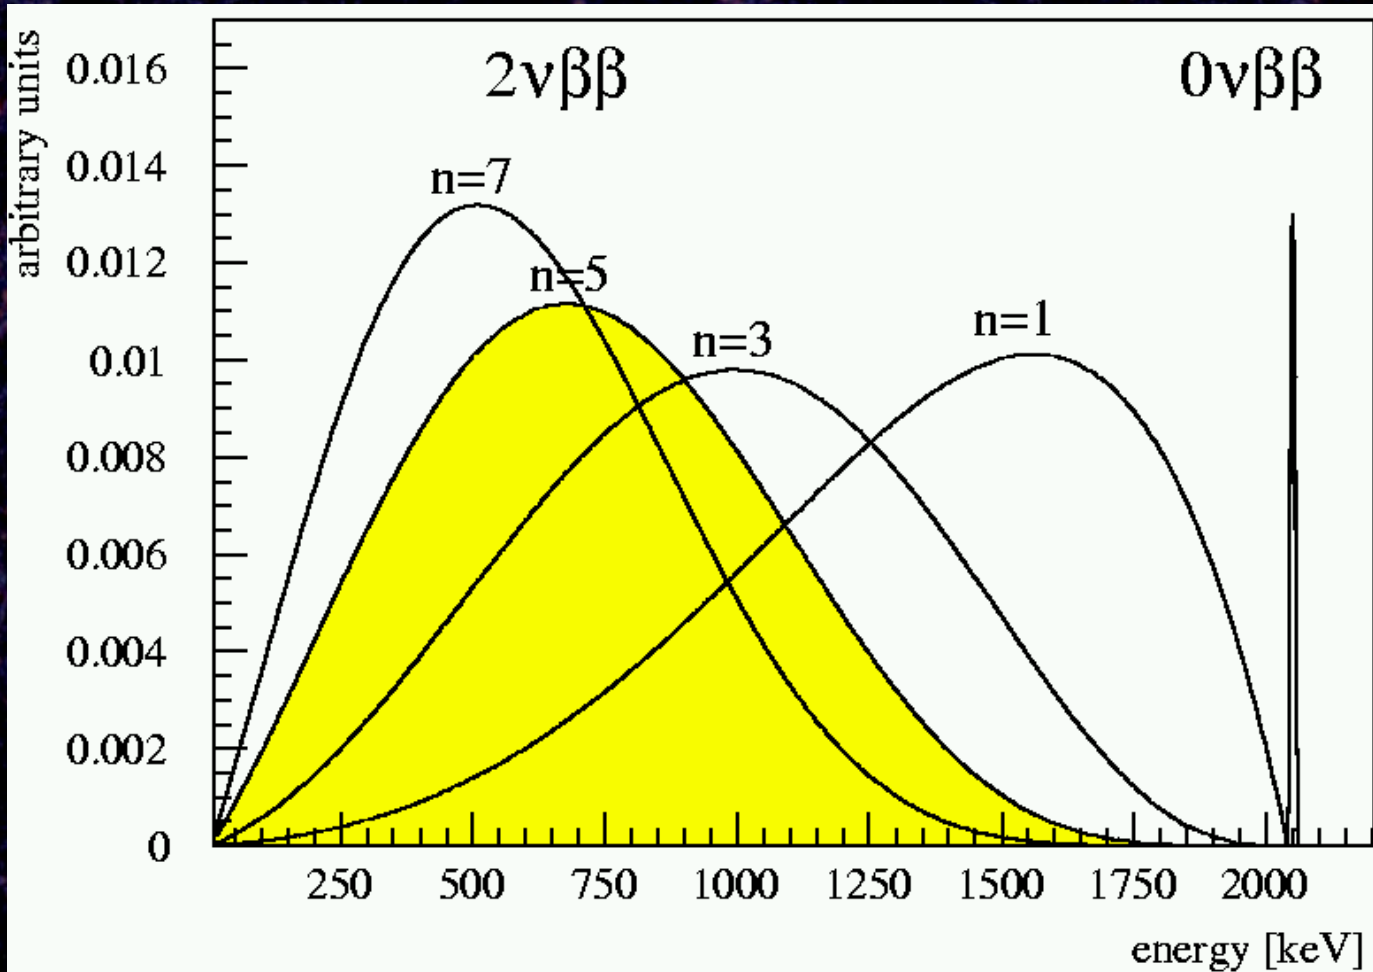

→  $m_\nu \neq 0$  since helicity  
has to "flip"  
→  $\bar{\nu} = \nu$

$$\frac{1}{t_{1/2}} = (\text{phase space}) \cdot \left( \frac{\langle m_\nu \rangle}{m_e} \right)^2 \cdot \left| \sum \mathbf{M}_{if} \right|^2$$

$0\nu\beta\beta$ : Peak at Q-value of nuclear transition

Sum energy spectrum of both electrons

# Cuoricino

Total detector mass: 40.7 kg  $\Rightarrow$  11.64 kg  $^{130}\text{Te}$

11 modules, 4 detector each,  
 crystal dimension: 5x5x5 cm<sup>3</sup>  
 crystal mass: 790 g  
 44 x 0.79 = 34.76 kg of TeO<sub>2</sub>

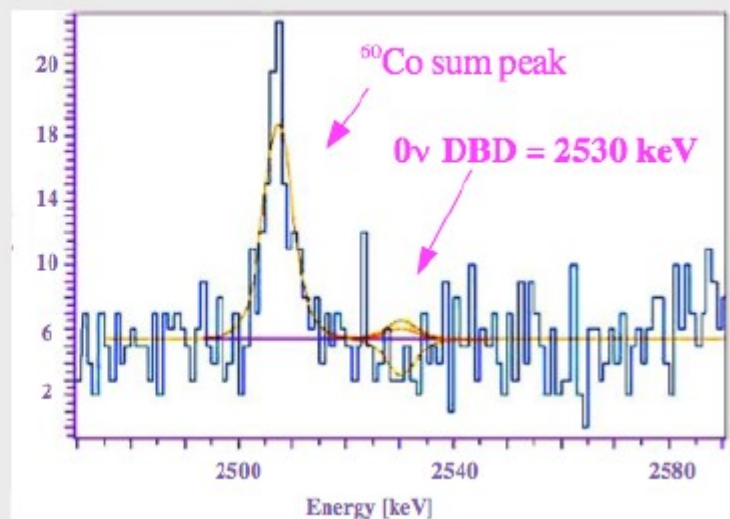

2 modules x 9 crystals each  
 crystal dimension: 3x3x6 cm<sup>3</sup>  
 April 2003 - May 2006

## 0ν -DBD result

$$\tau_{1/2} > 2.4 \cdot 10^{24} \text{ [y]}$$

@ 90% C.L.

# Large-scale $^{76}\text{Ge}$ experiments also proceeding.

## The Majorana Modular Approach

- 57 crystal module
  - Conventional vacuum cryostat made with electroformed Cu.
  - Three-crystal stack are individually removable.

$^{76}\text{Ge}$  effort also underway at LNGS.

## GERDA's Experimental Concept

Assumption: External background is dominant

- Minimize all impure materials close to *Ge* diodes
- Operate *Ge* diodes in ultraclean environment  
→ cryogenic liquid shield (LN or LAr); graded shielding

- Reject remaining background (internal and external) by exploiting different interaction topology  
(single-site ↔ multi-site; PSA)

Goal: Background index of  
0.001 cts / (keV kg y)  
at  $Q_{\beta\beta} = 2039$  keV

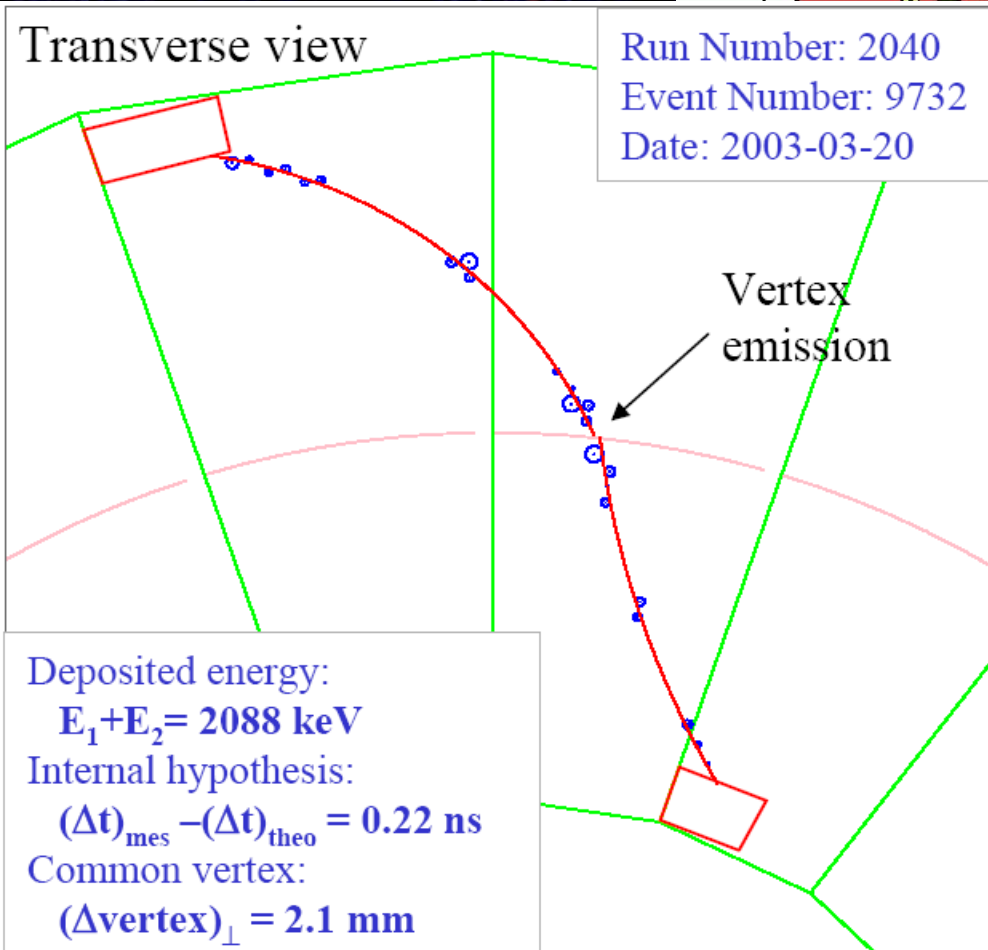

# NEMO-3

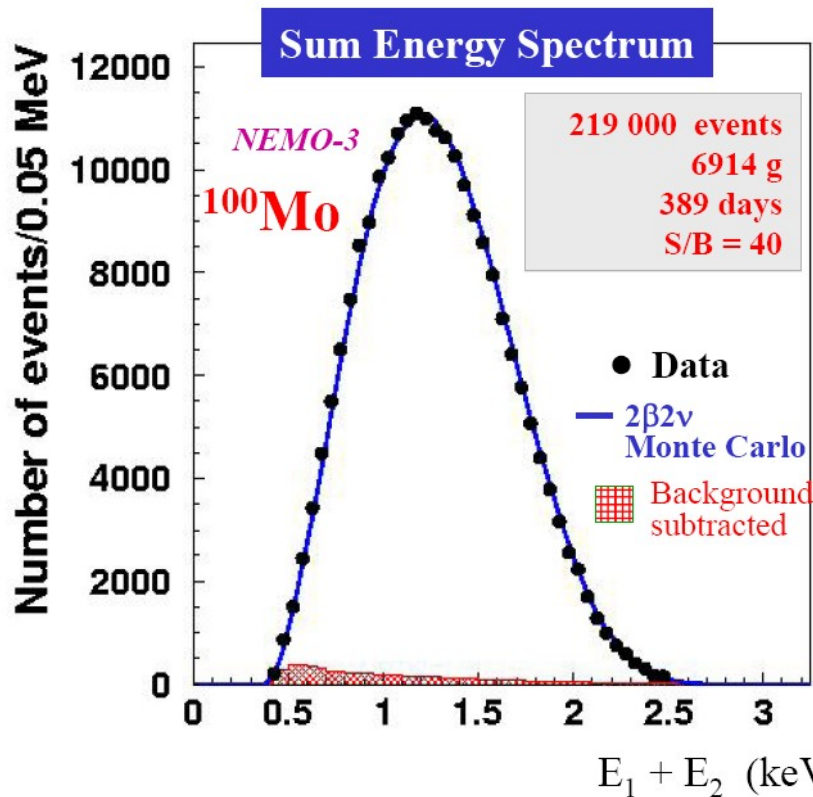

2.7m

1. Layout of the NEMO-3 detector.

## $^{100}\text{Mo}$ $2\beta 2\nu$ preliminary results

(Data Feb. 2003 – Dec. 2004)

7.37 kg.y

$T_{1/2} = 7.11 \pm 0.02$  (stat)  $\pm 0.54$  (syst)  $\times 10^{18}$  y

# Neutrinoless $\beta\beta$ -decay limits

Isotope	$T_{1/2}^{0\nu}$ (y)	$\langle m_\nu \rangle$ (eV)
$^{48}\text{Ca}$	$> 9.5 \times 10^{21}$ (76%)	$< 8.3$
$^{76}\text{Ge}$	$> 1.9 \times 10^{25}$	$< 0.35$
	$> 1.6 \times 10^{25}$	$< 0.33 - 1.35$
$^{82}\text{Se}$	$> 2.7 \times 10^{22}$ (68%)	$< 5$
$^{100}\text{Mo}$	$> 5.5 \times 10^{22}$	$< 2.1$
$^{116}\text{Cd}$	$> 7 \times 10^{22}$	$< 2.6$
$^{128,130}\text{Te}$	$\frac{T_{1/2}(130)}{T_{1/2}(128)} = (3.52 \pm 0.11) \times 10^{-4}$ (geochemical)	$< 1.1 - 1.5$
$^{128}\text{Te}$	$> 7.7 \times 10^{24}$	$< 1.1 - 1.5$
$^{130}\text{Te}$	$> 1.4 \times 10^{23}$	$< 1.1 - 2.6$
$^{136}\text{Xe}$	$> 4.4 \times 10^{23}$	$< 1.8 - 5.2$
$^{150}\text{Nd}$	$> 1.2 \times 10^{21}$	$< 3$

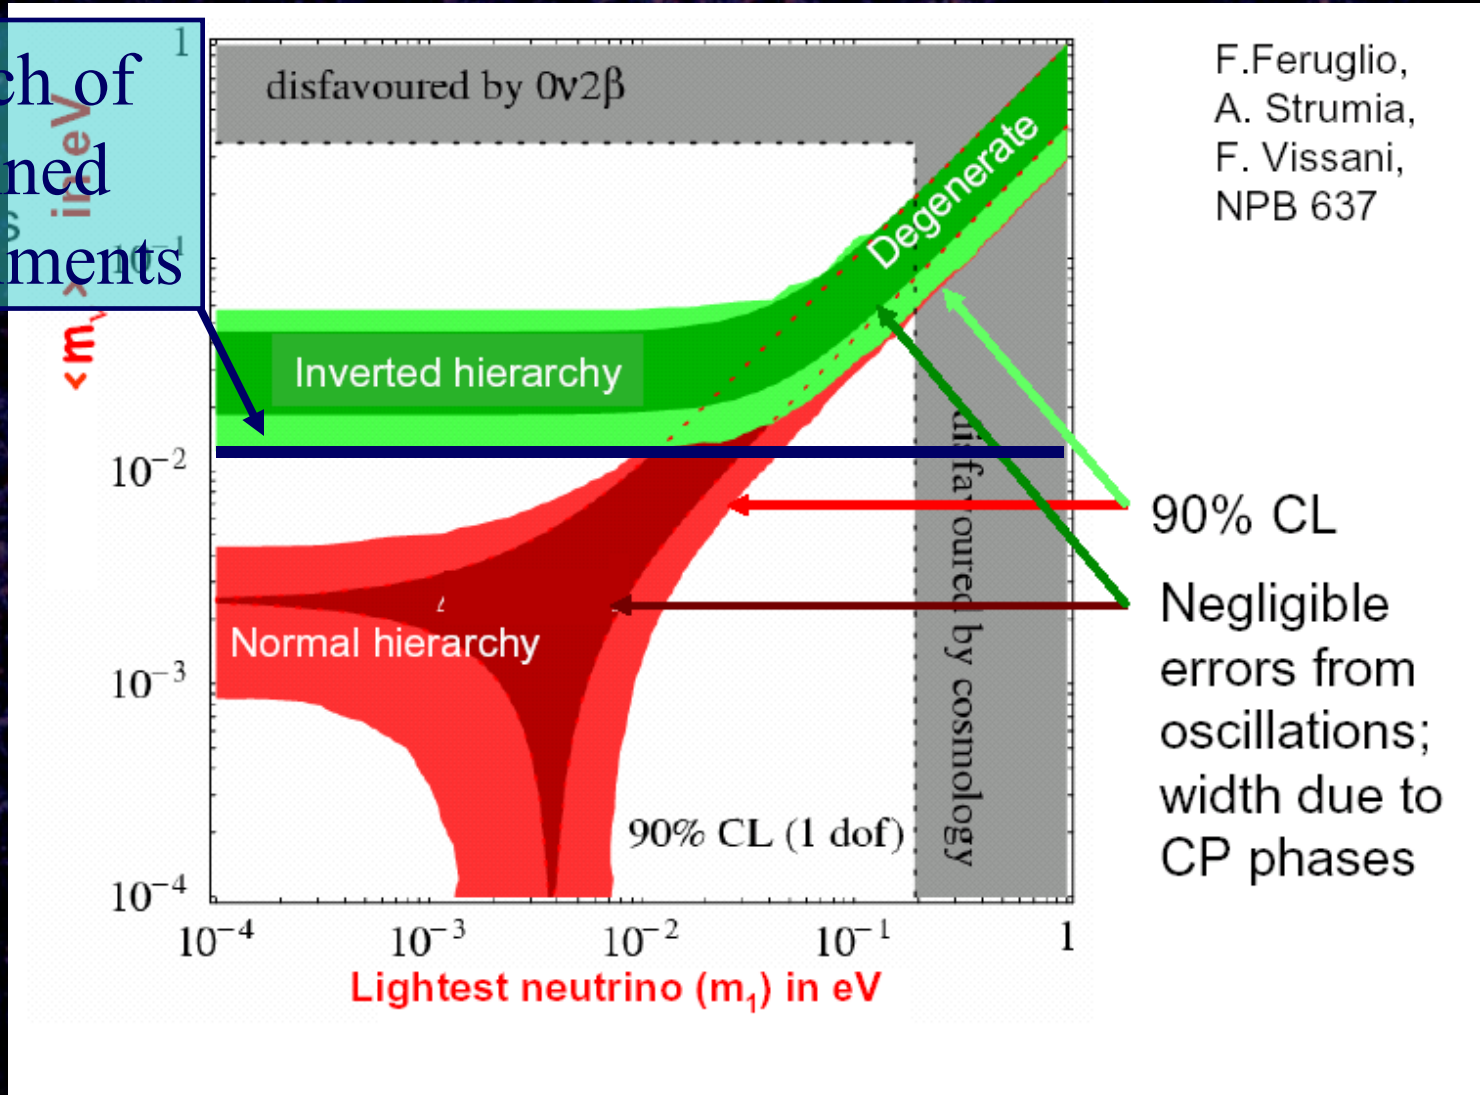

From Elliot and Vogel, hep-ph/0202264
