## Four point amplitude at strong coupling

Let's see how the prescription works for n = 4:

Consider  $k_1 + k_3 \rightarrow k_2 + k_4$ 

$$s = -(k_1 + k_2)^2, \qquad t = -(k_1 + k_4)^2$$

Need to find the minimal surface ending on such sequence of light-like segments.

• Warm up: Try to find the solution near one of the cusps.

Solution for the cusp (Kruczenski)

$$w = \sqrt{2} \rightarrow r = \sqrt{2}\sqrt{y_0^2 - y_1^2} = \sqrt{2y^+y^-}, \quad y^{\pm} = y^0 \pm y^1$$

- *S<sub>NG</sub>*: Poincare coordinates (*r*, *y*<sub>0</sub>, *y*<sub>1</sub>, *y*<sub>2</sub>) and parametrize the surface by its projection to (*y*<sub>1</sub>, *y*<sub>2</sub>) plane.
- Action for two fields  $r(y_1, y_2), y_0(y_1, y_2)$ . E.g. if s = t the fields live on a square parametrized by  $y_1, y_2$ .

$$S_{NG} = \frac{R^2}{2\pi} \int dy_1 dy_2 \frac{\sqrt{1 + (\partial_i r)^2 - (\partial_i y_0)^2 - (\partial_1 r \partial_2 y_0 - \partial_2 r \partial_1 y_0)^2}}{r^2}$$

• By scale invariance, edges of the square at  $y_1, y_2 = \pm 1$ 

## Boundary conditions

$$r(\pm 1, y_2) = r(y_1, \pm 1) = 0, \quad y_0(\pm 1, y_2) = \pm y_2, \quad y_0(y_1, \pm 1) = \pm y_1$$

< ロ > < 同 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ >

э

• We know the solution near the cusps. We can make some guess

$$y_0(y_1, y_2) = y_1y_2, \quad r(y_1, y_2) = \sqrt{(1 - y_1^2)(1 - y_2^2)}$$

- Easily seen to satisfy all the conditions and actually solves the eoms!
- However, s = t is somehow a boring case...

- 同 ト - ヨ ト - - ヨ ト

- We would like to capture the kinematical dependence of the amplitude. We need to consider s ≠ t.
- The square will be deformed to a rhombus

#### Embedding coordinates

$$-Y_{-1}^{2} - Y_{0}^{2} + Y_{1}^{2} + Y_{2}^{2} + Y_{3}^{2} + Y_{4}^{2} = -1$$
$$Y^{\mu} = \frac{y^{\mu}}{r}, \quad \mu = 0, ..., 3$$
$$Y_{-1} + Y_{4} = \frac{1}{r}, \quad Y_{-1} - Y_{4} = \frac{r^{2} + y_{\mu}y^{\mu}}{r}$$

Embedding coordinates surface

$$Y_0 Y_{-1} = Y_1 Y_2 \quad Y_3 = Y_4 = 0$$

• We can perform *SO*(2, 4) transformations and get new solutions. This is a "dual" conformal symmetry.

伺下 イヨト イヨト

How do we change the distance between opposite vertices?

• *e.g.* a boost in the 0 – 4 direction gives a new solution with  $s \neq t$ .

### After the boost

$$Y_4 = 0, \quad Y_0 Y_{-1} = Y_1 Y_2 \rightarrow Y_4 - v Y_0 = 0, \quad \sqrt{1 - v^2} Y_0 Y_{-1} = Y_1 Y_2$$

Two parameters solution

- Size of the square we started with.
- Boost parameter v.

- 4 同 6 4 日 6 4 日 6

## Conformal gauge action

$$iS = -\frac{R^2}{2\pi} \int du_1 du_2 \frac{1}{2} \frac{\partial r \partial r + \partial y_\mu \partial y^\mu}{r^2}$$

#### Solution for the rhombus

$$r = \frac{a}{\cosh u_1 \cosh u_2 + b \sinh u_1 \sinh u_2},$$
  

$$y_0 = r\sqrt{1 + b^2} \sinh u_1 \sinh u_2$$
  

$$y_1 = r \sinh u_1 \cosh u_2, \quad y_2 = r \cosh u_1 \sinh u_2$$

• The parameters *a* and *b* encode the kinematical information.

$$-s(2\pi)^2 = \frac{8a^2}{(1-b)^2}, \quad -t(2\pi)^2 = \frac{8a^2}{(1+b)^2}$$

- 4 同 6 4 日 6 4 日 6

Let's compute the area...

- Small problem: The area diverges!
- Dimensional reduction scheme: Theory in  $D = 4 2\epsilon$  dimensions but with 16 supercharges.
- For integer D this is exactly the low energy theory living on Dp-branes (p = D 1)

## Gravity dual

$$ds^{2} = h^{-1/2} dx_{D}^{2} + h^{1/2} \left( dr^{2} + r^{2} d\Omega_{9-D}^{2} \right), \qquad h = \frac{c_{D} \lambda_{D}}{r^{8-D}}$$
$$\lambda_{D} = \frac{\lambda \mu^{2\epsilon}}{(4\pi e^{-\gamma})^{\epsilon}} \qquad c_{D} = 2^{4\epsilon} \pi^{3\epsilon} \Gamma(2+\epsilon)$$

- 4 同 6 4 日 6 4 日 6

#### T-dual coordinates

$$ds^2 = \sqrt{\lambda_D c_D} \left( \frac{dy_D^2 + dr^2}{r^{2+\epsilon}} \right) \rightarrow S_{\epsilon} = \frac{\sqrt{\lambda_D c_D}}{2\pi} \int \frac{\mathcal{L}_{\epsilon=0}}{r^{\epsilon}}$$

- Presence of  $\epsilon$  will make the integrals convergent.
- The eoms will depend on  $\epsilon$  but if we plug the original solution into the new action, the answer is accurate enough.
- plugging everything into the action...

$$iS = -\frac{\sqrt{\lambda_D c_D}}{2\pi a^{\epsilon}} \left( \frac{\pi\Gamma\left[-\frac{\epsilon}{2}\right]^2}{\Gamma\left[\frac{1-\epsilon}{2}\right]} {}_2F_1\left(\frac{1}{2}, -\frac{\epsilon}{2}, \frac{1-\epsilon}{2}; b^2\right) + 1/2 \right) + \mathcal{O}(\epsilon)$$

• Just expand in powers of  $\epsilon...$ 

A 3 3 4 4

## Final answer

$$\mathcal{A} = e^{iS} = \exp\left[iS_{div} + \frac{\sqrt{\lambda}}{8\pi} \left(\log\frac{s}{t}\right)^2 + \tilde{C}\right]$$
$$S_{div} = 2S_{div,s} + 2S_{div,t}$$
$$S_{div,s} = -\frac{1}{\epsilon^2} \frac{1}{2\pi} \sqrt{\frac{\lambda\mu^{2\epsilon}}{(-s)^{\epsilon}}} - \frac{1}{\epsilon} \frac{1}{4\pi} (1 - \log 2) \sqrt{\frac{\lambda\mu^{2\epsilon}}{(-s)^{\epsilon}}}$$

• Should be compared to the field theory answer

$$\mathcal{A} \sim (\mathcal{A}_{div,s})^2 (\mathcal{A}_{div,t})^2 \exp\left\{\frac{f(\lambda)}{8}(\ln s/t)^2 + const\right\}$$
$$\mathcal{A}_{div,s} = \exp\left\{-\frac{1}{8\epsilon^2}f^{(-2)}\left(\frac{\lambda\mu^{2\epsilon}}{s^{\epsilon}}\right) - \frac{1}{4\epsilon}g^{(-1)}\left(\frac{\lambda\mu^{2\epsilon}}{s^{\epsilon}}\right)\right\}$$

- The general structure of the solution is perfect agreement with the BDS conjecture.
- *SO*(2, 4) transformations fixed somehow the kinematical dependence of the finite piece.
- This dual conformal symmetry constrains the form of the amplitude

$$\begin{split} \mathcal{A} &\sim f\left(\left(\log\frac{r_{cut}^2}{s}\right)^2 + \left(\log\frac{r_{cut}^2}{t}\right)^2\right) + \tilde{g}\left(\log\frac{r_{cut}^2}{s} + \log\frac{r_{cut}^2}{t}\right) + \\ &+ f\left(\log\frac{s}{t}\right)^2 + const + \mathcal{O}(r_{cut}) \end{split}$$

• Up to a term independent on the kinematics, we get the same finite piece!

同 ト イ ヨ ト イ ヨ ト

 Imagine the cusps are located at x<sub>i</sub> and the cut-off depends on the point at the boundary, r<sub>cut</sub>(x): r<sub>cut</sub>(x<sub>i</sub>) → r<sub>i</sub>

$$\mathcal{A} \sim f \sum_{i} \left( \log \frac{r_i^2}{x_{i-1,i+1}^2} \right)^2 + g \sum_{i} \left( \log \frac{r_i^2}{x_{i-1,i+1}^2} \right) + Fin(x_i)$$

• The dual *SO*(2, 4) symmetries will move the points *x<sub>i</sub>*, *r<sub>i</sub>* and the area should be invariant.

$$a.K = \sum_{i} x_{i}^{2} a.\partial_{x_{i}} - 2a.x_{i} (x_{i}.\partial_{x_{i}} + r_{i}\partial_{r_{i}})$$

- KA = 0 fixes the finite piece for n = 4 and n = 5!
- Also observed perturbatively (Drummond, Henn, Korchemsky, Sokatchev )

# Wilson loops vs. Scattering amplitudes

- This computation shows a relation between Wilson loops and scattering amplitudes.
- This relation holds also at weak coupling! Drummond, Korchemsky, Sokatchev; Henn, Brandhuber...
- Write BDS on a slightly different way

$$\log \mathcal{M}_n = Div_n + \frac{f(\lambda)}{4}a_1(k_1, k_2, ..., k_n) + h(\lambda) + nk(\lambda)$$

Scattering amplitudes vs. WL (Brandhuber, Heslop, Travaglini)

$$\langle W_{k_i} \rangle = 1 + \lambda \left( \text{Div} + w_1(k_1, ..., k_n) + c + n\tilde{c} \right)$$

$$\psi$$
  
 $w_1(k_1,...,k_n) = a_1(k_1,...,k_n)$ 

• BDS 
$$\Rightarrow$$
  $a_{strong} = f^{strong} a_1(k_1, ..., k_n)$ 

- WL vs. Amplitudes at strong coupling  $\Rightarrow a_{strong} = w_{strong}$
- WL vs. Amplitudes at weak coupling  $\Rightarrow a_1 = w_1$

- For n = 4 and n = 5 that is the case! but fixed by symmetries.
- We need to take n > 5, what about  $n = \infty$ ?

- 4 同 ト 4 ヨ ト 4 ヨ ト

We choose a zig-zag configuration that approximates the rectangular Wilson loop.

• The BDS ansatz predicts  $\log < W_{rect}^{strong} >= \sqrt{\lambda} \frac{1}{4} \frac{T}{L}$ 

• The strong coupling result is not what we would expect from the BDS ansatz, hence something needs to be revised...

・ 同 ト ・ ヨ ト ・ ヨ ト

At which order in perturbation theory and for how many gluons will BDS fail?

- BDS  $\Rightarrow$   $a_{\ell} = f^{(\ell)}a_1(k_1, ..., k_n)$
- WL vs. Amplitudes at all orders  $\Rightarrow a_\ell = w_\ell$

$$\psi_{2} = f^{(2)} w_{1}(k_{1},...,k_{n})$$

- An explicit computation for the rectangular Wilson loop, shows that either the BDS conjecture or the relation between WL and amplitudes (or both!) fail at two loops for a large number of gluons.
- You will hear more about it!!

伺 ト イ ヨ ト イ ヨ ト

# What have we done?

- A prescription for computing planar scattering amplitudes on  $\mathcal{N}=4$  SYM at strong coupling by using the AdS/CFT duality.
- We have done detailed computations for *n* = 4 but the prescription is valid for any number of gluons.
- Our results agree in all detail with the conjecture of Bern, Dixon and Smirnov for n = 4 and for n = 5 they should also agree, but the conjecture may need to be revised for large number of gluons.
- A small step towards understanding the iterative structures for gluon amplitudes from the string theory point of view.

(日) (同) (三) (三)

# What things need to be done?

- Try to make explicit computations for *n* > 4, *e.g. n* = 6 is a good one.
- We haven't assume/use at all the machinery of integrability.
- Subleading corrections in  $1/\sqrt{\lambda}$ ? Information about helicity of the particles, etc.
- Gross and Mende computed higher genus amplitudes (in flat space) using similar ideas, can we do the same?
- Can we repeat the computation in other backgrounds?
- Deeper relation among Wilson loops and scattering amplitudes?
- Some powerful alternative to BDS?
