Anderson localization of a Rydberg electron along a class

Can we expect Anderson Localization signatures in time?

Rydberg atom in a fluctuating microwave field - 1D AL

Integrable 1D system:
$$(z, p) \rightarrow (\theta, I)$$

 $H_0(z, p) \longrightarrow H_0(I) \implies I = const, \quad \theta = \frac{\partial H_0(I)}{\partial I}t + \theta_0.$

Add time periodic perturbation:

$$H_1 = f(t) \ z \ \longrightarrow \ H_1 = \sum_n \sum_k g_n(I) f_k \left(e^{i(n\theta + k\omega t)} + e^{i(n\theta - k\omega t)} \right)$$

Around the resonance condition:

$$\omega = \frac{\partial H_0(\boldsymbol{I_r})}{\partial \boldsymbol{I_r}},$$

We can look at system in rotating frame:

 $\Theta=\theta-\omega t$

where for small perturbation new angle Θ is varying slowly:

$$\dot{\Theta} = \frac{\partial \boldsymbol{H}(I)}{\partial I} - \boldsymbol{\omega} \approx 0$$

A. Buchleitner, D. Delande, J. Zakrzewski Physics Reports 368 (2002)

Krzysztof Giergiel, Krzysztof Sacha

Anderson localization of a Rydberg electron along a clas

Small perturbation:

 $P = I - I_r \approx 0$

We can restric H_0 to lowest order:

$$H_0 \approx \frac{P^2}{2} \frac{\partial^2 H_0(\boldsymbol{I_r})}{\partial \boldsymbol{I_r}^2} = \frac{P^2}{2m_{eff}}$$

Average out fast variables:

$$H_1 = \sum_n \sum_k g_k(I) f_k \left(e^{i(n(\Theta + \omega t) + k\omega t)} + e^{i(n(\Theta + \omega t) - k\omega t)} \right) \approx \sum_k g_k(I) f_{-k} e^{ik\Theta}.$$

In total we get:

$$H_{eff} = \langle H \rangle_t = \frac{P^2}{2m_{eff}} + F \sum_k g_k f_{-k} e^{ik\Theta}.$$

$$H_{eff} = \frac{P^2}{2m_{eff}} + F \sum_k g_k f_{-k} e^{ik\Theta}$$

 m_{eff} is given by H_0 :

$$m_{eff}^{-1} = \frac{\partial^2 H_0(\boldsymbol{I_r})}{\partial \boldsymbol{I_r}^2},$$

 g_n 's are given by interaction structure in H_1 :

$$z = \sum_k g_k e^{ik\theta}$$

But experimentator gets full control over f_k 's:

$$f(t) = \sum_{k} f_{k} e^{ik\omega t}$$

(3)

We ask experimentator for:

- resonant state (ω),
- perturbative regime (F),
- fluctuating driving $(f_k$'s).

Э

Quantum description

First option: Quantization of the classical H_{eff}

$$P \to \hat{P} \tag{5}$$
$$\Theta \to \hat{\Theta} \tag{6}$$

$$\hat{H}_{eff} = \frac{\hat{P}^2}{2m_{eff}} + F \sum_k g_k f_{-k} e^{ik\hat{\Theta}}$$

And erson localized states if localization length smaller than $2\pi.$

э

Second option: Effective Hamiltonian perturbative expansion directly in quantum description:

$$U = e^{-i\hat{n}\omega t}$$

$$\langle n'|H_{eff}|n\rangle = -\frac{1}{2\hat{n}^2} - \omega\hat{n} + F\langle n'|\hat{z}|n\rangle f_{n'-n}$$
(8)

Close to resonance we can identify semiclassical Hamiltonian:

$$\hat{P} \approx (\hat{n} - \omega^{-\frac{1}{3}}) \qquad \langle n' | \hat{z} | n \rangle \approx \langle | \omega^{-\frac{1}{3}} + (n' - n) | \hat{z} | \omega^{-\frac{1}{3}} \rangle = g_{n' - n} \qquad (9)$$

$$\hat{H}_{eff} = \frac{\hat{P}^2}{2m_{eff}} + F \sum_k g_k f_{-k} e^{ik\hat{\Theta}}$$

Laboratory frame: $(E, z, t) \rightarrow (n, \Theta) \approx (I, \theta - \omega t)$.

◆□ → ◆□ → ◆臣 → ◆臣 → □ 臣

$$H = \frac{p^2}{2} - \frac{1}{|\vec{r}|} + Fzf(t)$$

Kepler ellipse:

- \bullet J orbit radius,
- $\bullet~\theta$ position of electron on the orbit,
- $L \approx$ shape of the elliptical orbit,
- $\bullet \ \psi$ -angle between semi-major axis and field polarization.

1D model is the limit with $L \to 0$ and $\psi = 0$. How to force system into stable point for those parameters?:

$$H = \frac{p^2}{2} - \frac{1}{|\vec{r}|} + Fz\cos(\omega t) + F_s z$$

K. Sacha, J. Zakrzewski, and D. Delande, Europ. Phys. J. D 1, 231 (2002)

$$H = \frac{p^2}{2} - \frac{1}{|\vec{r}|} + Fzf(t) + F_s z$$

Kepler ellipse:

- J orbit radius,
- θ position of electron on the orbit,
- $L \approx$ shape of the elliptical orbit,
- $\bullet \ \psi$ -angle between semi-major axis and field polarization.

$$H_{eff} = \frac{P^2}{2m_{eff}} + F \sum_{k \neq 0} U_k(L, \Psi) f_{-k} e^{ik\Theta} + F_s V(L, \Psi)$$

New parameters L, Ψ must be well defined or the Anderson Localization will not occur. In AL language "disorder is not quenched".

Anderson localization of a Rydberg electron along a class

Conclusions

- We have considered perturbation of a system that is regular in space but <u>disordered in time</u>.
- It turns out that temporal disorder induces Anderson Localization in the time domain.
- Anderson localization in time may be realized in different systems (hydrogen atom, BEC, possibly solid state systems).
