Based on: 2005.07285 and 2104.11765

# Background

Proton helicity can be decomposed into spin and orbital angular momentum (OAM) of quarks and gluons [Jaffe and Manohar, 1990]

$$\frac{1}{2} = S_q + S_G + L_q + L_G \quad (1)$$

where

$$S_q(Q^2) = \frac{1}{2} \int_0^1 dx \Delta\Sigma(x, Q^2) = \frac{1}{2} \int_0^1 dx \sum_f [\Delta q_f(x, Q^2) + \Delta \bar{q}_f(x, Q^2)]. \quad (2)$$

Experiments have measured  $S_q$  but can only include  $0 < x_{\min} \leq x \leq 1$ .

**Objective:** Find the contribution to  $S_q$  coming from  $\Delta\Sigma$  as  $x \rightarrow 0$ .

At small Bjorken- $x$ , quark helicity distribution satisfies

$$\Delta\Sigma(x, Q^2) = \frac{N_c N_f}{2\pi^3} \int_{\Lambda^2/s}^1 \frac{dz}{z} \int_{1/zs}^{1/zQ^2} \frac{dx_{10}^2}{x_{10}^2} \int d^2\underline{b} Q(\underline{x}_1, \underline{x}_0, z), \quad (3)$$

where  $\underline{b} = \frac{\underline{x}_0 + \underline{x}_1}{2}$  and  $\underline{x}_{10} = \underline{x}_1 - \underline{x}_0$ .

Here,  $Q(\underline{x}_1, \underline{x}_0, z) \equiv Q_{10}(z)$  is the quark (longitudinally) polarized dipole amplitude.

# Quark Unpolarized Dipole Amplitude

$S_{10}(z)$  corresponds to a minus-moving quark dipole interacting with a plus-moving target proton, represented by the blue rectangle.

$$S_{10}(z) = \begin{array}{c} \underline{x}_0 \text{ --- } \rightarrow \text{ --- } \\ \underline{x}_1 \text{ --- } \leftarrow \text{ --- } \end{array} \begin{array}{c} \text{blue rectangle} \end{array} + \begin{array}{c} \underline{x}_0 \text{ --- } \leftarrow \text{ --- } \\ \underline{x}_1 \text{ --- } \rightarrow \text{ --- } \end{array} \begin{array}{c} \text{blue rectangle} \end{array} \\ = \frac{1}{2N_c} \text{Re} \left[ \left\langle \mathcal{T} \text{tr} \left[ V_{\underline{0}} V_{\underline{1}}^\dagger \right] \right\rangle (z) + \left\langle \mathcal{T} \text{tr} \left[ V_{\underline{1}} V_{\underline{0}}^\dagger \right] \right\rangle (z) \right]. \quad (4)$$

- $V_{\underline{i}}$  is the fundamental Wilson's line at  $\underline{x}_i$ .
- The angle brackets average over target proton's wave function.

# Quark Polarized Dipole Amplitude

Diagrammatically,  $Q_{10}(z)$  corresponds to a quark dipole, one of which has helicity  $\sigma$ , interacting with a polarized target proton (blue rectangle).

$$Q_{10}(z) = \frac{zs}{2N_c} \text{Re} \left[ \left\langle \mathcal{T} \text{tr} \left[ V_{\underline{0}} V_{\underline{1}}^{\text{pol} \dagger} \right] \right\rangle (z) + \left\langle \mathcal{T} \text{tr} \left[ V_{\underline{1}}^{\text{pol}} V_{\underline{0}}^\dagger \right] \right\rangle (z) \right]. \quad (5)$$

- $V_{\underline{0}}$  is the fundamental unpolarized Wilson's line at  $\underline{x}_0$ .
- $V_{\underline{1}}^{\text{pol}}$  is the fundamental *polarized Wilson's line* at  $\underline{x}_1$ .
- The angle brackets average over target proton's wave function.
- At Born level,  $Q_{10}(z) \sim 1$  because the helicity-dependent tree-level cross-section  $\sim \frac{1}{zs}$ .

# Gluon Polarized Dipole Amplitude

Similar to quark, consider a gluon dipole, one of which has helicity  $\lambda$ , interacting with a polarized target proton (blue rectangle).

$$G_{10}(z) = \frac{zS}{2(N_c^2 - 1)} \text{Re} \left[ \left\langle \mathcal{T} \text{tr} \left[ U_{\underline{0}} U_{\underline{1}}^{\text{pol} \dagger} \right] \right\rangle (z) + \left\langle \mathcal{T} \text{tr} \left[ U_{\underline{1}}^{\text{pol}} U_{\underline{0}}^\dagger \right] \right\rangle (z) \right]. \quad (6)$$

- $U_{\underline{0}}$  is the adjoint unpolarized Wilson's line at  $\underline{x}_0$ .
- $U_{\underline{1}}^{\text{pol}}$  is the adjoint *polarized Wilson's line* at  $\underline{x}_1$ .
- The angle brackets average over target proton's wave function.

# Evolution

- The polarized dipole amplitudes obey integral equations resulting from quark/gluon splitting outside the target shockwave:

- To the first order in  $\alpha_s$ , both dipole amplitudes evolve as

$$\alpha_s \left[ \underbrace{\int \frac{dz'}{z'} \int \frac{dx_{21}^2}{x_{21}^2}}_{\text{Double-logarithmic}} + \underbrace{\int dz' \int \frac{dx_{32}^2}{x_{32}^2} + \int \frac{dz'}{z'} \int dx_{21}^2}_{\text{Single-logarithmic}} + \dots \right] \times (\text{dipole amplitudes}).$$

- The single-logarithmic (SLA) terms (resumming  $\alpha_s \ln \frac{1}{x}$ ) are subleading to the double-logarithmic (DLA) term (resumming  $\alpha_s \ln^2 \frac{1}{x}$ ).

# Longitudinally Soft Parton Emission

- In a splitting in the limit  $z' \ll z$ , the longitudinal  $z'$ -integral is logarithmic, giving the evolution terms

$$\alpha_s \int \frac{dz'}{z'} \left[ \underbrace{A \int \frac{dx_{21}^2}{x_{21}^2}}_{\text{DLA}} + \underbrace{B \int dx_{21}^2}_{\text{SLA}_L} \right] \text{ (dipole amps)} \quad (7)$$

- $\text{SLA}_L$ : single-logarithmic term with logarithmic longitudinal integral.

# Longitudinally Hard Parton Emission

- In the limit  $z' \sim z$ , a parton splitting yields the  $SLA_T$  terms, i.e. single-logarithmic terms with logarithmic transverse integral

$$\alpha_s \int dz' \Delta P(z'/z) \int \frac{dx_{32}^2}{x_{32}^2} \text{ (dipole amps)} \quad (8)$$

- Since  $z' \sim (z - z') \sim z$ , neither  $\underline{x}_3$  nor  $\underline{x}_2$  is close to  $\underline{x}_1$ , but we still have  $x_{32} \ll x_{10}$ .

# Full Evolution Equations

Including both soft and hard parton emissions, we have up to SLA:

$$\begin{aligned}
 \frac{1}{N_c} \langle \langle \text{tr} [V_0 V_1^{p\text{ol}1}] \rangle \rangle(z_{\text{min}}, z_{\text{pol}}) &= \frac{1}{N_c} \langle \langle \text{tr} [V_0 V_1^{p\text{ol}1}] \rangle \rangle_0(z_{\text{pol}}) + \frac{1}{2\pi^2} \int_{\Lambda^2/s}^{z_{\text{pol}}} \frac{dz'}{z'} \int_{1/(z's)}^{z_{\text{pol}}} d^2x_2 \\

 \end{aligned}$$

- SLA $_T$  terms are written in blue.
- The running coupling correction is SLA and also has to be included.

# Full Evolution Equations

Including both double-log (DLA) and single-log (SLA) terms, we have

$$\begin{aligned}
 \frac{1}{N_c} \left\langle \left\langle \text{tr} \left[ V_0 V_1^{\text{pol}\dagger} \right] \right\rangle \right\rangle (z_{\text{min}}, z_{\text{pol}}) &= \frac{1}{N_c} \left\langle \left\langle \text{tr} \left[ V_0 V_1^{\text{pol}\dagger} \right] \right\rangle \right\rangle_0 (z_{\text{pol}}) + \frac{1}{2\pi^2} \int_{\Lambda^2/s}^{z_{\text{min}}} \frac{dz'}{z'} \int_{1/(z's)}^{z_{\text{min}}} d^2x_2 \\
 &\times \left[ \left( \frac{\alpha_s(1/x_{21}^2)}{x_{21}^2} \theta(x_{10}^2 z_{\text{min}} - x_{21}^2 z') - \alpha_s(\min\{1/x_{21}^2, 1/x_{20}^2\}) \frac{x_{21} - x_{20}}{x_{21}^2 x_{20}^2} \theta(x_{10}^2 z_{\text{min}} - \max\{x_{21}^2, x_{20}^2\} z') \right) \right. \\
 &\quad \times \frac{2}{N_c} \left\langle \left\langle \text{tr} \left[ t^b V_0 t^a V_1^\dagger \right] U_2^{\text{pol}\text{ba}} \right\rangle \right\rangle (z', z') \\
 &\quad + \frac{\alpha_s(1/x_{21}^2)}{x_{21}^2} \theta(x_{10}^2 z_{\text{min}} - x_{21}^2 z') \frac{1}{N_c} \left\langle \left\langle \text{tr} \left[ t^b V_0 t^a V_2^{\text{pol}\dagger} \right] U_1^{\text{ba}} \right\rangle \right\rangle (z', z') \Big] \\
 &+ \frac{1}{2\pi^2} \int_{\Lambda^2/s}^{z_{\text{min}}} \frac{dz'}{z'} \int_{1/(z's)}^{z_{\text{min}}} d^2x_2 K_{\text{rcBK}}(\underline{x}_0, \underline{x}_1; \underline{x}_2) \theta(x_{10}^2 z_{\text{min}} - x_{21}^2 z') \\
 &\quad \times \frac{1}{N_c} \left[ \left\langle \left\langle \text{tr} \left[ V_0 V_2^\dagger \right] \text{tr} \left[ V_2 V_1^{\text{pol}\dagger} \right] \right\rangle \right\rangle (z', z_{\text{pol}}) - N_c \left\langle \left\langle \text{tr} \left[ V_0 V_1^{\text{pol}\dagger} \right] \right\rangle \right\rangle (z', z_{\text{pol}}) \right] \\
 &- \frac{1}{2\pi^2} \int_0^{z_{\text{pol}}} \frac{dz'}{z_{\text{pol}}} \int_{\frac{x_{\text{pol}}}{z'(z_{\text{pol}}-z')}} \frac{d^2x_{32}}{x_{32}^2} \theta(x_{10}^2 z_{\text{min}} z_{\text{pol}} - x_{32}^2 z'(z_{\text{pol}} - z')) \alpha_s \left( \frac{1}{x_{32}^2} \right) \\
 &\quad \times \left[ \frac{1}{N_c} \left\langle \left\langle \text{tr} \left[ t^b V_0 t^a V_1^\dagger \right]_{\underline{x}_1 - \frac{z'}{z_{\text{pol}}} \underline{x}_{32}} \right] U_{\underline{x}_1 + (1 - \frac{z'}{z_{\text{pol}}}) \underline{x}_{32}}^{\text{pol}\text{ba}} \right\rangle \right\rangle (\min\{z_{\text{min}}, z', z_{\text{pol}} - z'\}, z') \\
 &\quad + \frac{1}{N_c} \left\langle \left\langle \text{tr} \left[ t^b V_0 t^a V_2^{\text{pol}\dagger} \right]_{\underline{x}_1 + (1 - \frac{z'}{z_{\text{pol}}}) \underline{x}_{32}} \right] U_{\underline{x}_1 - \frac{z'}{z_{\text{pol}}} \underline{x}_{32}}^{\text{ba}} \right\rangle \right\rangle (\min\{z_{\text{min}}, z', z_{\text{pol}} - z'\}, z') \Big] \\
 &+ \frac{C_F}{2\pi^2} \int_0^{z_{\text{pol}}} \frac{dz'}{z_{\text{pol}}} \left( 1 + \frac{z'}{z_{\text{pol}}} \right) \int_{\frac{x_{\text{pol}}}{z'(z_{\text{pol}}-z')}} \frac{d^2x_{32}}{x_{32}^2} \theta(x_{10}^2 z_{\text{min}} z_{\text{pol}} - x_{32}^2 z'(z_{\text{pol}} - z')) \alpha_s \left( \frac{1}{x_{32}^2} \right) \\
 &\quad \times \frac{1}{N_c} \left\langle \left\langle \text{tr} \left[ V_0 V_1^{\text{pol}\dagger} \right] \right\rangle \right\rangle (\min\{z_{\text{min}}, z', z_{\text{pol}} - z'\}, z_{\text{pol}}).
 \end{aligned}$$

- SLA<sub>T</sub> terms are written in blue.
- The running coupling correction is SLA and also has to be included.

# Closed Evolution Equations

- At large  $N_c$  and large  $N_c \& N_f$ , the equations become closed but *non-linear* because the evolution of unpolarized dipoles are also SLA.
- For example, at large  $N_c$ , (half of) the equations are:

$$\begin{aligned}
 G_{10}(z_{\min}, z_{\text{pol}}) &= G_{10}^{(0)}(z_{\text{pol}}) + \frac{N_c}{\pi^2} \int_{\Lambda^2/s}^{z_{\min}} \frac{dz'}{z'} \int_{1/(z's)} d^2x_2 \\
 &\times \left( \frac{\alpha_s(1/x_{21}^2)}{x_{21}^2} \theta(x_{10}^2 z_{\min} - x_{21}^2 z') - \alpha_s(\min\{1/x_{21}^2, 1/x_{20}^2\}) \frac{x_{21} \cdot x_{20}}{x_{21}^2 x_{20}^2} \theta(x_{10}^2 z_{\min} - \max\{x_{21}^2, x_{20}^2\} z') \right) \\
 &\times [G_{21}(z', z') S_{20}(z') + \Gamma_{20,21}^{\text{gen}}(z', z') S_{21}(z')] \\
 &+ \frac{N_c}{2\pi^2} \int_{\Lambda^2/s}^{z_{\min}} \frac{dz'}{z'} \int_{1/z's} d^2x_2 K_{\text{rcBK}}(\underline{x}_0; \underline{x}_1; \underline{x}_2) \theta(x_{10}^2 z_{\min} - x_{21}^2 z') \left[ G_{21}(z', z_{\text{pol}}) S_{20}(z') - \Gamma_{10,21}^{\text{gen}}(z', z_{\text{pol}}) \right] \\
 &- \frac{N_c}{\pi^2} \int_0^{z_{\text{pol}}} \frac{dz'}{z_{\text{pol}}} \int_{\frac{x_{\text{pol}}}{z'(x_{\text{pol}}-z')}} d^2x_{32} \frac{d^2x_{32}}{x_{32}^2} \alpha_s \left( \frac{1}{x_{32}^2} \right) \theta(x_{10}^2 z_{\min} z_{\text{pol}} - x_{32}^2 z'(z_{\text{pol}} - z')) \\
 &\times \left[ G_{\underline{x}_1 + (1 - \frac{z'}{z_{\text{pol}}}) \underline{x}_{32}, \underline{x}_1 - \frac{z'}{z_{\text{pol}}} \underline{x}_{32}}(z_{\min}, z') S_{10}(z_{\min}) + \Gamma_{10,32}(z_{\min}, z') \right] \\
 &+ \frac{N_c}{2\pi^2} \int_0^{z_{\text{pol}}} \frac{dz'}{z_{\text{pol}}} \left( 2 - \frac{z'}{z_{\text{pol}}} + \frac{z'^2}{z_{\text{pol}}^2} \right) \int_{\frac{x_{\text{pol}}}{z'(x_{\text{pol}}-z')}} d^2x_{32} \frac{d^2x_{32}}{x_{32}^2} \alpha_s \left( \frac{1}{x_{32}^2} \right) \theta(x_{10}^2 z_{\min} z_{\text{pol}} - x_{32}^2 z'(z_{\text{pol}} - z')) \\
 &\times \Gamma_{10,32}(z_{\min}, z_{\text{pol}}).
 \end{aligned}$$

# Asymptotic Solution – What do we know so far?

The equations up to DLA have been analytically solved at large  $N_c$  [Kovchegov et al, 2017] and numerically solved at large  $N_c \& N_f$  [Kovchegov and Tawabutr, 2020].

- At large  $N_c$ , the quark helicity PDF has the asymptotic form

$$\Delta\Sigma(x, Q^2) \sim (1/x)^{\alpha_h^q}. \quad (9)$$

- At large  $N_c \& N_f$ , the asymptotic form displays oscillation pattern

$$\Delta\Sigma(x, Q^2) \sim (1/x)^{\alpha_h^q} \cos[\omega_q \ln(1/x) + \varphi_q]. \quad (10)$$

In both cases,  $\alpha_h^q \approx \frac{4}{\sqrt{3}} \sqrt{\frac{\alpha_s N_c}{2\pi}}$ , and  $\omega_q$  is small and increases with  $N_f$ .

- Phenomenological implications were studied in [Adamiak et al, 2021].

Solutions to closed SLA equations are left for future work.

# Conclusion

- Quark's helicity contribution to proton spin follows evolution equations that contain leading DLA terms and subleading SLA terms.
- The SLA terms have been derived, with the effects of running coupling included, as the latter is also single-logarithmic.
- In the large- $N_c$  and large- $N_c \& N_f$  limits, the equations are closed but non-linear, since the unpolarized evolution is single-logarithmic.
- Future work:
  - Connection to the polarized DGLAP evolution
  - Numerical solutions to the SLA evolution equations at large  $N_c$  and large  $N_c \& N_f$
  - Phenomenological implications

# The End

# Running Coupling

- For soft unpolarized parton emission, the strong coupling constant runs the same way as the unpolarized BK evolution [Kovchegov and Weigert, 2007] [Balitsky, 2007]
- For other splitting terms, i.e. soft polarized or hard parton emission, the strong coupling constant runs with the transverse size of the daughter dipole, e.g.

With this prescription, there is no double counting with the  $SLA_T$  terms.

# Polarized Wilson Lines

$$\begin{aligned}
 V_{\underline{x}}^{pol} &= \frac{igp_1^+}{s} \int_{-\infty}^{\infty} dx^- V_{\underline{x}}[+\infty, x^-] F^{12}(x^-, \underline{x}) V_{\underline{x}}[x^-, -\infty] \\
 &\quad - \frac{g^2 p_1^+}{s} \int_{-\infty}^{\infty} dx_1^- \int_{x_1^-}^{\infty} dx_2^- V_{\underline{x}}[+\infty, x_2^-] t^b \psi_{\beta}(x_2^-, \underline{x}) U_{\underline{x}}^{ba}[x_2^-, x_1^-] \left[ \frac{1}{2} \gamma^+ \gamma^5 \right]_{\alpha\beta} \bar{\psi}_{\alpha}(x_1^-, \underline{x}) t^a V_{\underline{x}}[x_1^-, -\infty]. \\
 (U_{\underline{x}}^{pol})^{ab} &= \frac{2igp_1^+}{s} \int_{-\infty}^{+\infty} dx^- (U_{\underline{x}}[+\infty, x^-] \mathcal{F}^{12}(x^+ = 0, x^-, \underline{x}) U_{\underline{x}}[x^-, -\infty])^{ab} \\
 &\quad - \frac{g^2 p_1^+}{s} \int_{-\infty}^{\infty} dx_1^- \int_{x_1^-}^{\infty} dx_2^- U_{\underline{x}}^{aa'}[+\infty, x_2^-] \bar{\psi}(x_2^-, \underline{x}) t^{a'} V_{\underline{x}}[x_2^-, x_1^-] \frac{1}{2} \gamma^+ \gamma_5 t^{b'} \psi(x_1^-, \underline{x}) U_{\underline{x}}^{b'b}[x_1^-, -\infty] + c.c..
 \end{aligned}$$

The polarized dipole amplitudes depend on two momentum fractions.

$$\left\langle \text{tr} \left[ V_{\underline{x}_0} V_{\underline{x}_1}^\dagger(\sigma) \right] \right\rangle(z) \Rightarrow \left\langle \text{tr} \left[ V_{\underline{x}_0} V_{\underline{x}_1}^\dagger(\sigma) \right] \right\rangle \left( \underbrace{\min\{z, z_0\}}_{\text{minimum}}, \underbrace{z}_{\text{polarized}} \right)$$

# SLA Evolution Equations

Include not only the terms coming from the splitting of the polarized line.

- Since the evolutions of both polarized and unpolarized lines are SLA, they have to be included.
- The running coupling correction is SLA and also has to be included.

At SLA, the evolution of the dipole amplitude depends on momentum fractions of two lines – the polarized line and the softest-parton line.
