

Introduction to particle physics: experimental part

Discovery of the Higgs boson

Measurements: mass, spin, couplings

Three years of LHC operations

Energy frontier

The LHC

- Circumference 27 km
- Up to 175 m underground
- Total number of magnets 9 553
- Number of dipoles 1 232
- Operation temperature 1.9 K (Superfluid He)

$$\mathcal{L} = \frac{N_p^2 k_b f_{rev} \gamma}{4\pi \beta^* \epsilon_n} F$$

Parameter	2010	2011	2012	Nominal
C.O.M Energy	7 TeV	7 TeV	8 TeV	14 TeV
Bunch spacing / k	150 ns / 368	50 ns / 1380	50 ns / 1380	25 ns / 2808
ϵ (mm rad)	2.4-4	1.9-2.3	2.5	3.75
β^* (m)	3.5	1.5-1	0.6	0.55
L (cm ⁻² s ⁻¹)	2x10 ³²	3.3x10 ³³	~7x10 ³³	10 ³⁴

The first LHC run

2010
O(2) Pile-up events

150 ns inter-bunch spacing

2010
0.05 fb^{-1}
at 7 TeV

2011

O(10) Pile-up events

50 ns inter-bunch spacing

Design value
(expected to be reached at $L=10^{34}$!)

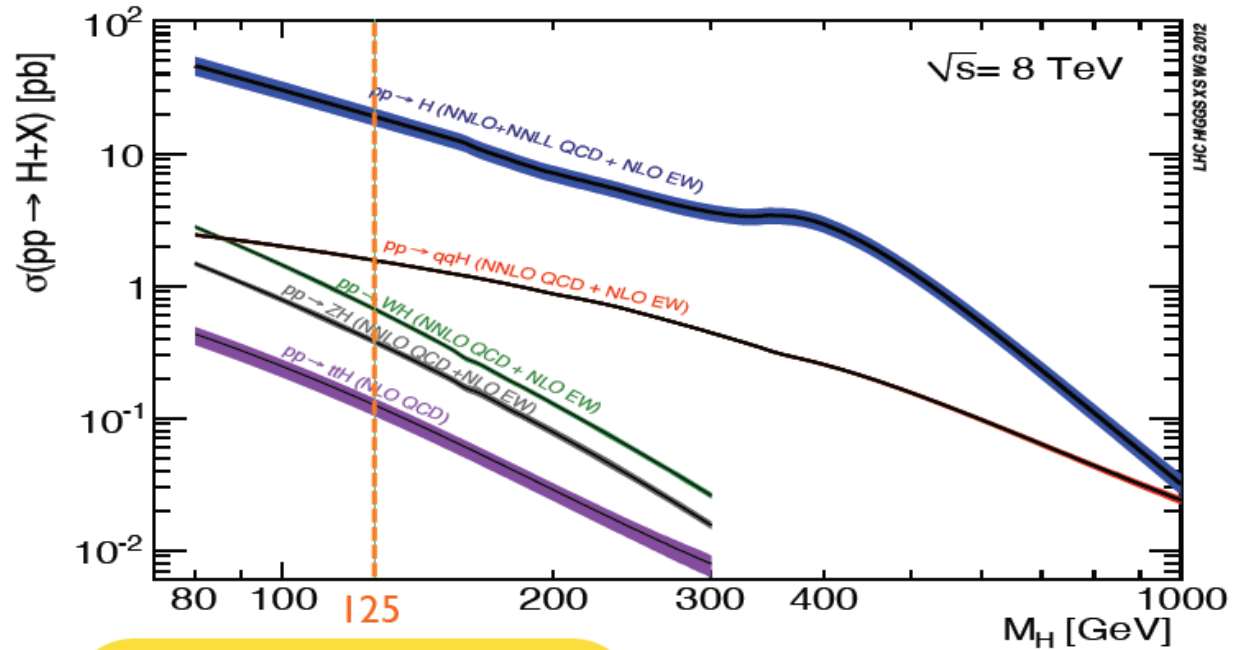

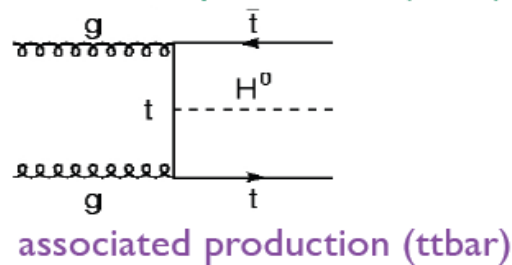

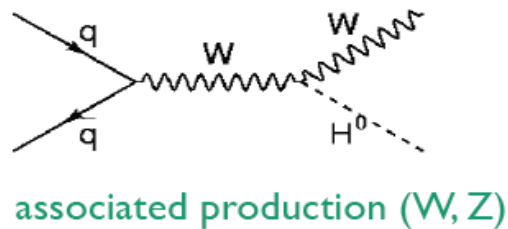

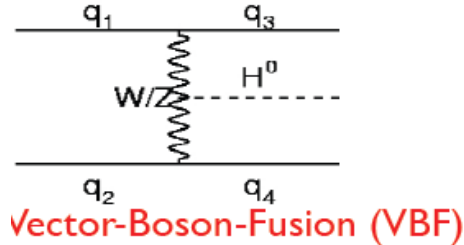

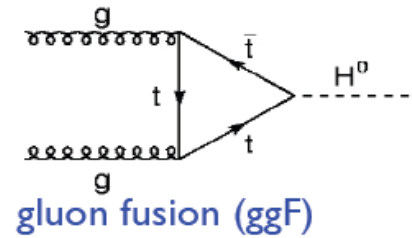

2012

O(20) Pile-up events

50 ns inter-bunch spacing

SM Higgs production at the LHC

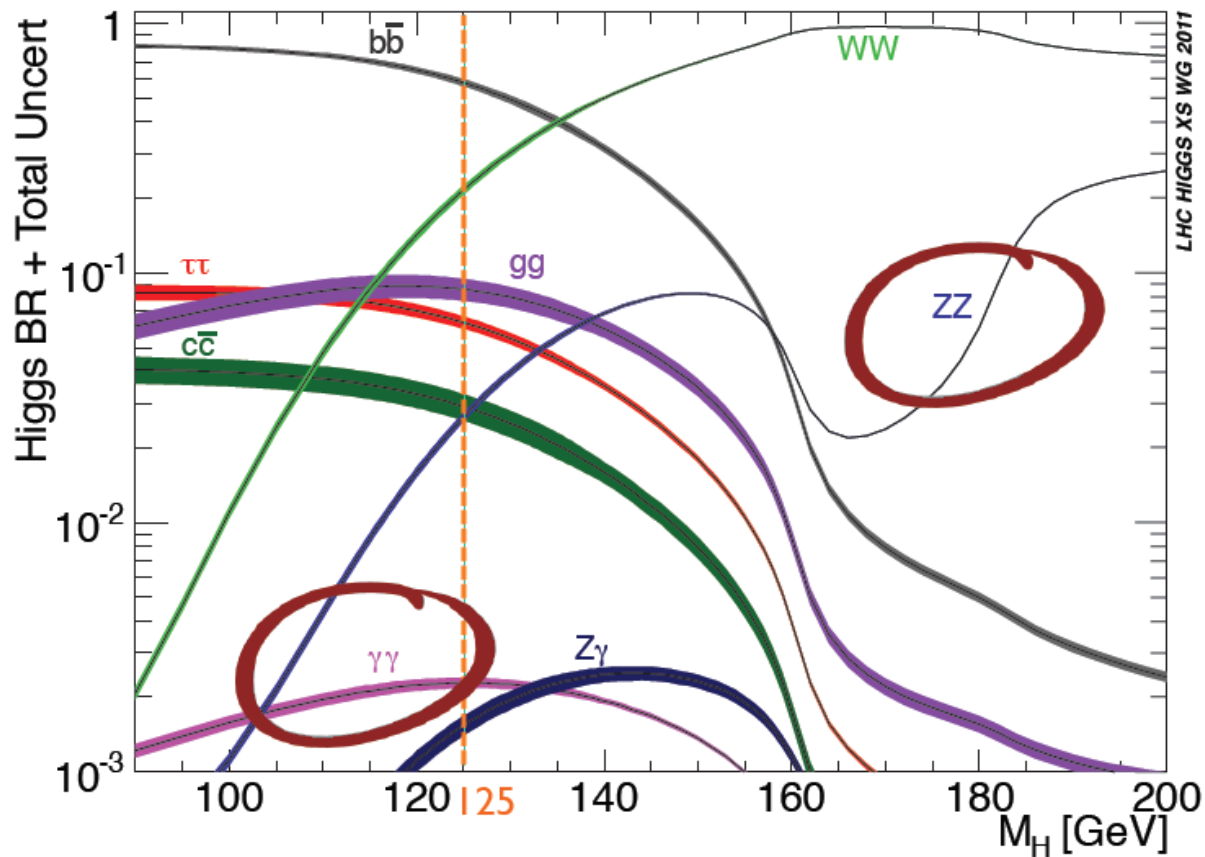

$$\sigma(125 \text{ GeV}) = 22.3 \text{ pb}$$

2 Higgs bosons @
 m_H 125 GeV produced
 at LHC in 2012 every
 10^{10} pp collisions

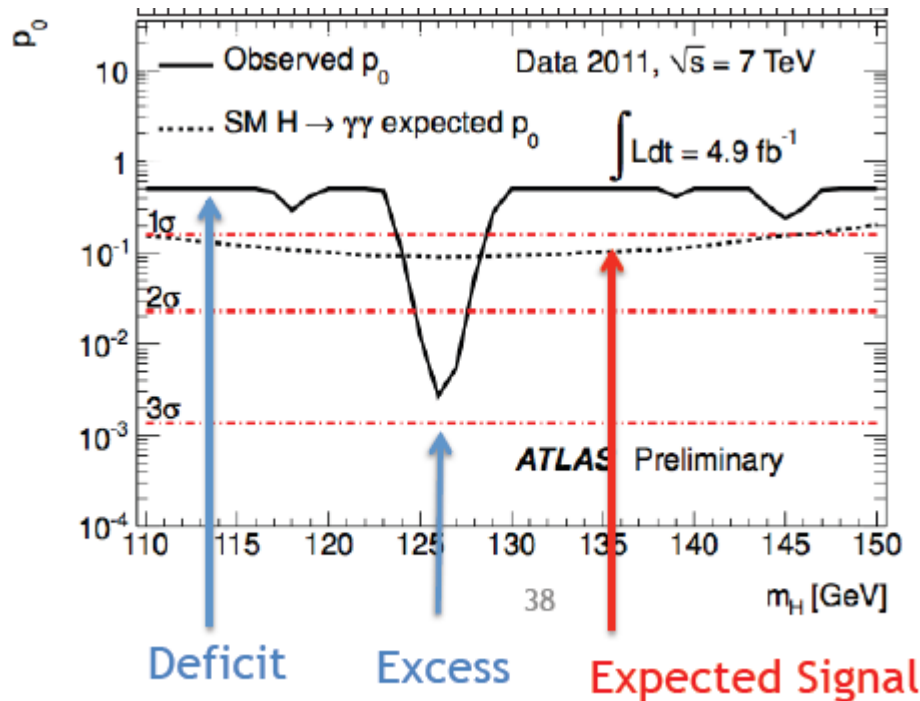

SM Higgs decays

- 1 Higgs every 10 s
- 1 $H \rightarrow \gamma\gamma$ every 1.5 h
- 1 $H \rightarrow ZZ \rightarrow 4\ell$ ($\ell = e$ or μ) every 2 days

Local p_0

Probability that the background can produce a fluctuation greater than or equal to the excess observed in data. Equivalent in terms of number of standard deviations is called local significance.

Birth of a particle (different prospective) ICHEP (July 2012)

Higgs-like particle

- We are living in a privileged moment in the history of High Energy Physics: **first fundamental scalar**
- The discovery came at half of the design energy, much more severe pile-up and one-third of integrated luminosity than was originally judged as necessary.

ATLAS [PLB 716 \(2012\) 1-29](#), Sept 17 (2012)

Largest local excess:
5.9 σ at $m_H = 126.5 \text{ GeV}$

$H \rightarrow \gamma\gamma, bb, \tau\tau, WW(\ell\nu\ell\nu, \ell\nu q\bar{q}), ZZ(4\ell, \ell\nu\nu, \ell\ell q\bar{q})$

CMS [PLB 716 \(2012\) 30-61](#), Sept 17 (2012)

Largest local excess:
5.0 σ at $m_H = 125.5 \text{ GeV}$

$H \rightarrow \gamma\gamma, bb, \tau\tau, WW(\ell\nu\ell\nu), ZZ(4\ell, \ell\ell\tau, \ell\nu\nu, \ell\ell q\bar{q})$

Higgs-like particle

Phys.Lett. B716 (2012) 1-29

Phys.Lett. B716 (2012) 30-61

H- $\rightarrow\gamma\gamma$: events signature

Simple event signature

- ❑ Two high p_T photons
 $p_{T_1} > 40$ GeV and $p_{T_2} > 30$ GeV
- ❑ High trigger efficiency
~99%
- ❑ High event selection efficiency despite high jet-jet & γ -jet production
~40%
- ❑ High signal over background
~3-10 % (depending on sub-category)

Invariant mass reconstruction $m_{\gamma\gamma}^2 = 2 * E_1 E_2 (1 - \cos \alpha)$

- ❑ Good energy calibration
- ❑ Robust primary vertex reconstruction
- ➔ Excellent invariant mass resolution ~1.6 GeV with 90% of events within $\pm 2\sigma$

Shower shapes and vertex reconstr.

Photon ID 2 – Photon shower shapes and background rejection

- Photons shower shape distributions in LAr sampling layers - different for signal and background (π^0)

Vertex Reconstruction

$$m_{\gamma\gamma}^2 = 2 * E_1 E_2 (1 - \cos \alpha)$$

□ Vertex reconstructed through likelihood combination

- Calorimeter 'pointing'
- Σ tracks pT^2
- Conversion vertex
- Mean vertex position

H- $\rightarrow\gamma\gamma$: background rejection

➔ Reducible background γ -jet and jet-jet largely below irreducible background $\gamma\gamma$

- ▶ Remark 1: this decomposition is not directly used in the Higgs search: the background is extrapolated from data sidebands
- ▶ Remark 2: Drell-Yan \sim negligible for $m_{\gamma\gamma} > 100 \text{ GeV}$ ($\sim 1\%$)

Event categorisation

Event categories based on eta, p_{Tt} , and conversion

Both unconverted:

- Central
- Rest

At least one converted:

- Central
- Transition
- Rest

Resolution:

- Good
- Medium
- Poor

Central and Rest divided into $p_{Tt} < 60$ GeV and $p_{Tt} > 60$ GeV

Energy calibration and resolution

$$m_{\gamma\gamma}^2 = 2 * E_1 E_2 (1 - \cos \alpha)$$

- MC based calibration improved with energy scale and resolution corrections based on in-situ analysis of $Z \rightarrow ee$, $W \rightarrow ev$ and $J/\psi \rightarrow ee$
- Energy scale at m_Z known to 0.3%, uniformity (constant term) 1% in barrel, 1.2 – 2.1% in endcap

The golden channel $Z \rightarrow l\bar{l}$

In a m_{4l} window
around 120-130 GeV:

	Signal	$ZZ^{(*)}$	$Z + \text{jets}, t\bar{t}$	Observed
4μ	2.09 ± 0.30	1.12 ± 0.05	0.13 ± 0.04	6
$2e2\mu/2\mu2e$	2.29 ± 0.33	0.80 ± 0.05	1.27 ± 0.19	5
$4e$	0.90 ± 0.14	0.44 ± 0.04	1.09 ± 0.20	2

Signal and background

Irreducible background

The final state is exactly the same, but it does not come from the particle you are looking for

Reducible background

The final state looks like the same, but some of the particles fake what you are looking for

Selection

- Cut on particle properties to reduce reducible background
 - ✓ Shower shapes, track properties, ...
- Cut on event properties to distinguish signal from background
 - ✓ Particle kinematics, decay kinematics event shape, ...
- Try to keep signal while reducing background!
 - ✓ Increase S/B

Reconstruct properties of initial particles

- We have 4 particles...
 - ✓ ... with their energy (calorimeters), charge and momentum (tracker)

- Use pairs of opposite sign e^+e^- and $\mu^+\mu^-$

- Reconstruct invariant mass from the 4 particles
$$M = \sqrt{\left(\sum E_i\right)^2 - \left(\sum \vec{p}_i\right)^2}$$

Signal and background

Background gets estimated...

- ✓ ... from simulation (normalized to data)
- ✓ ... directly from data (“control regions”, enriched in background events)

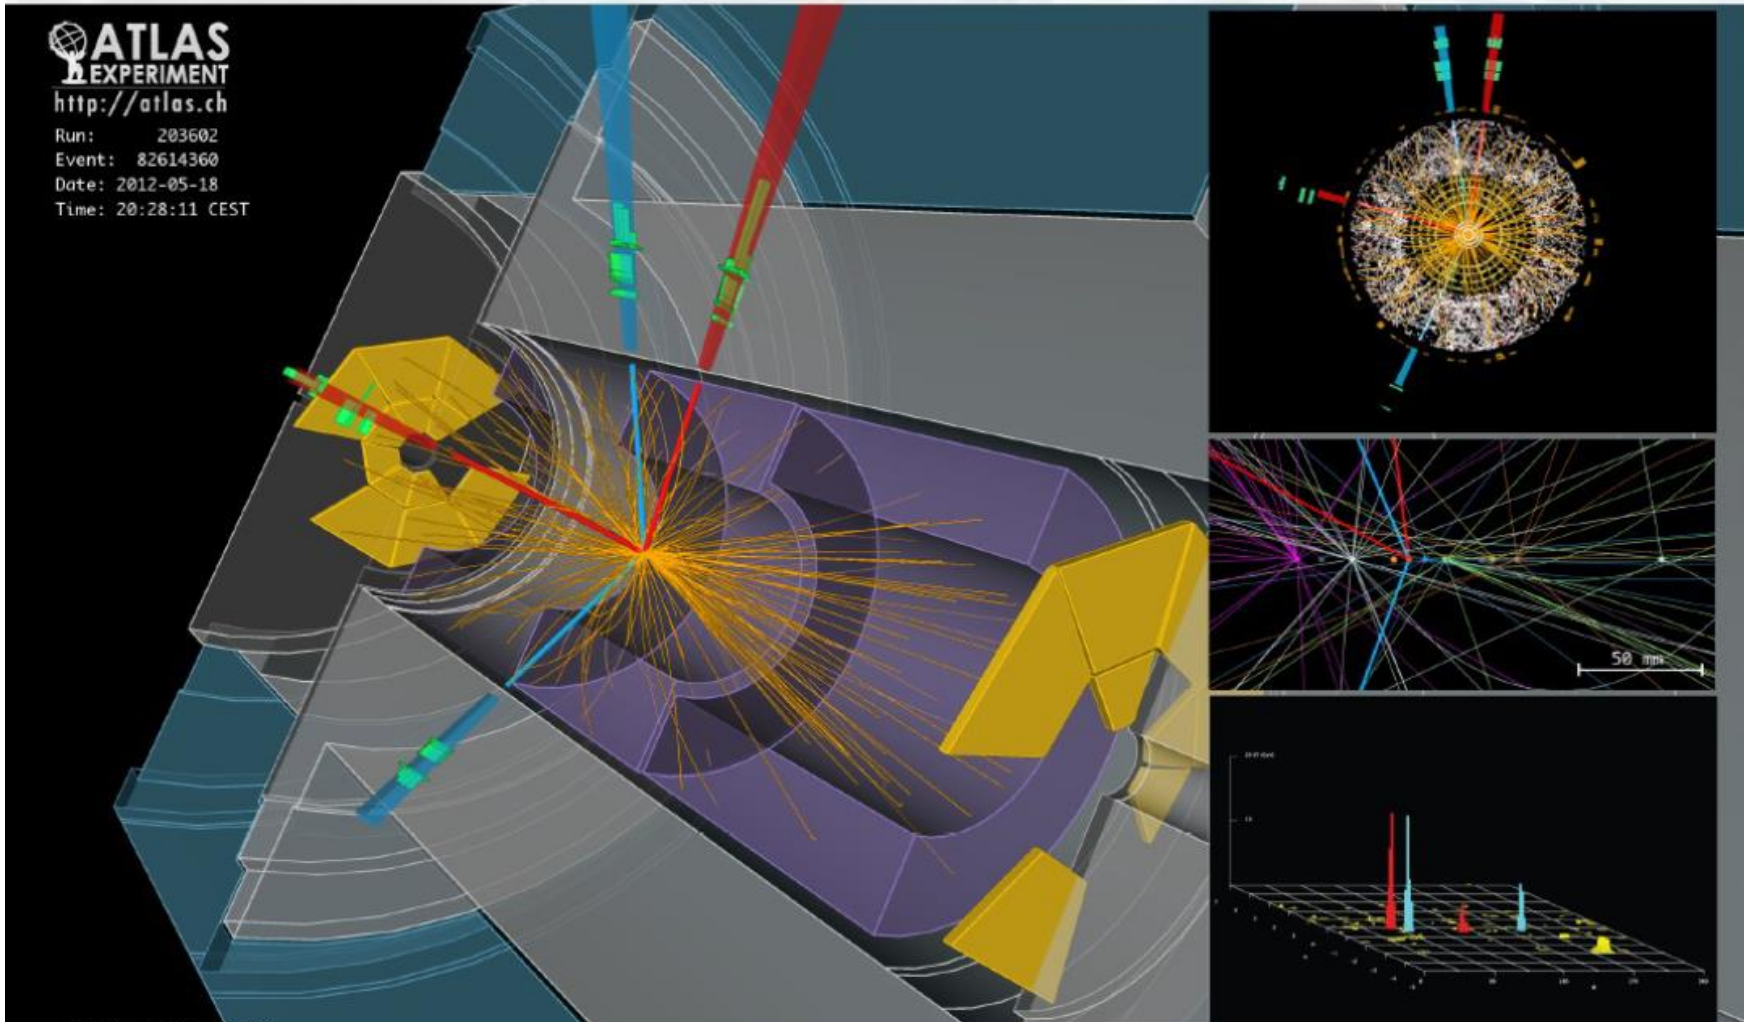

4e candidate. $m_{4\ell} = 124.6$ GeV, $m_{12} = 70.6$ GeV, $m_{34} = 44.7$ GeV.

e_1 : $P_T = 24.9$ GeV, $\eta = -0.33$, $\phi = 1.98$

e_2 : $P_T = 53.9$ GeV, $\eta = -0.40$, $\phi = 1.69$

e_3 : $P_T = 61.9$ GeV, $\eta = -0.12$, $\phi = 1.45$

e_4 : $P_T = 17.8$ GeV, $\eta = -0.51$, $\phi = 2.84$

4μ candidate. $m_{4\ell} = 125.1$ GeV, $m_{12} = 86.3$ GeV, $m_{34} = 31.6$ GeV.

$\mu_1: P_T = 36.1$ GeV, $\eta = 1.29$, $\phi = 1.33$ $\mu_2: P_T = 47.5$ GeV, $\eta = 0.69$, $\phi = -1.65$

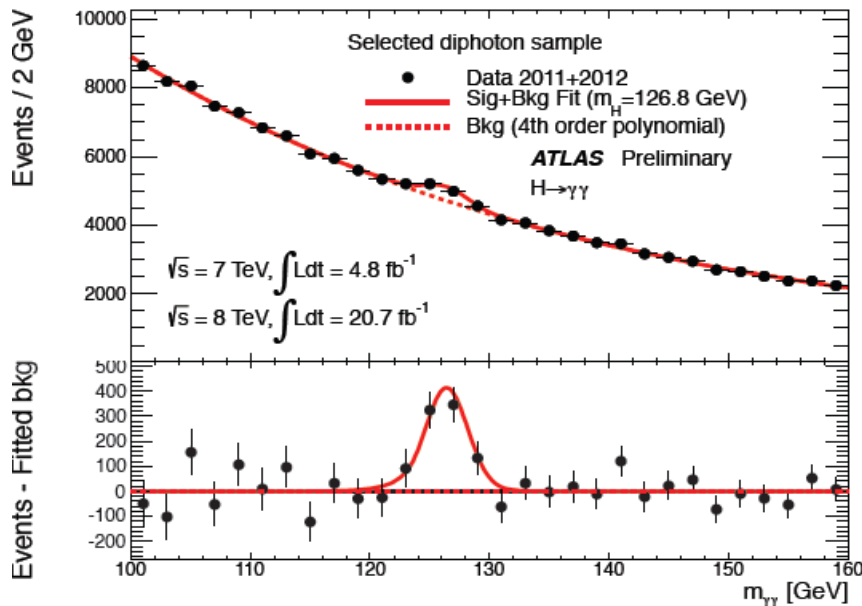

$\mu_3: P_T = 26.4$ GeV, $\eta = 0.47$, $\phi = -2.51$ $\mu_4: P_T = 71.7$ GeV, $\eta = 1.85$, $\phi = 1.65$

Higgs like signal with 7 TeV and 8 TeV data

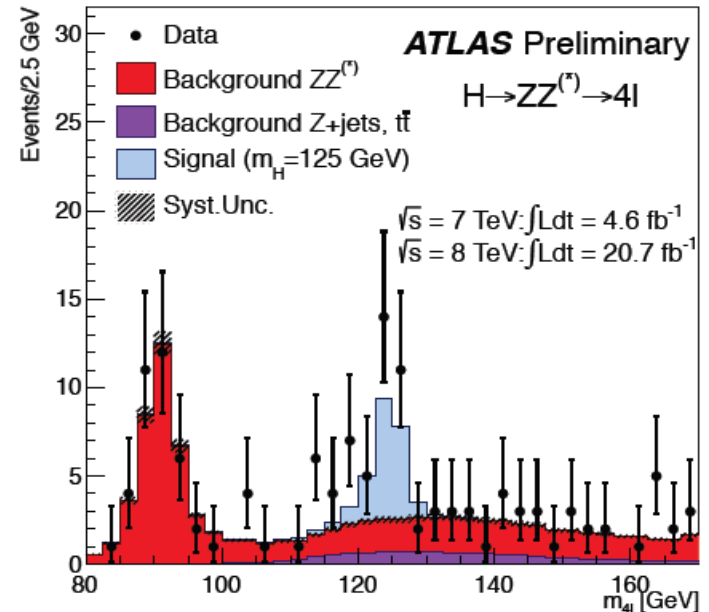

2013

$H \rightarrow \gamma\gamma$

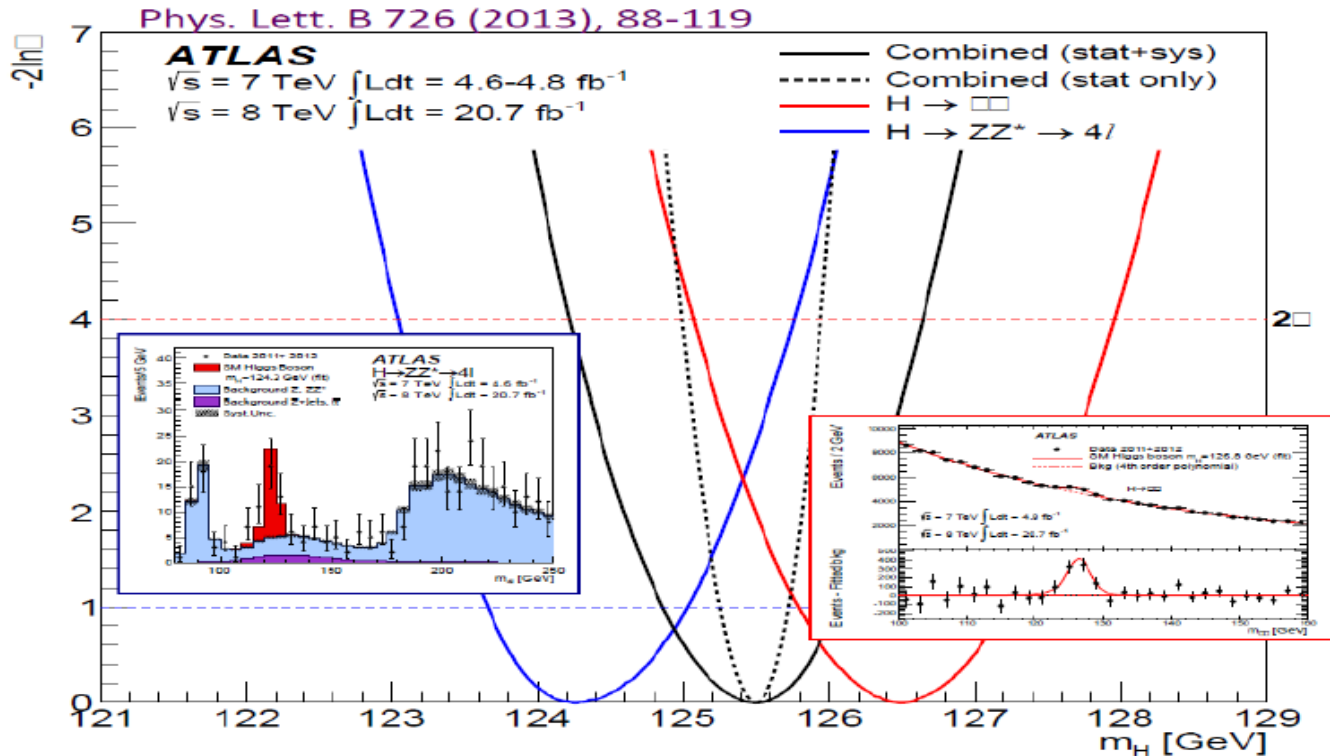

- Signal significance = 7.4σ
- $m_H = 126.8 \pm 0.2$ (stat) ± 0.7 (syst) GeV
- $\mu = 1.65 \pm 0.34$ (deviation w.r.t. SM at 2.3σ)

$H \rightarrow 4l$

- Signal significance = 6.6σ
- $m_H = 124.3^{+0.6}_{-0.5}$ (stat) $^{+0.6}_{-0.3}$ (syst) GeV
- $\mu = 1.7 \pm 0.34$

Mass measurement

$$4\ell: M_H = 124.3 \pm 0.6_{\text{stat}} \pm 0.4_{\text{sys}} \text{ GeV}$$

$$\gamma\gamma: M_H = 126.8 \pm 0.2_{\text{stat}} \pm 0.7_{\text{sys}} \text{ GeV}$$

$$\text{Combined: } M_H = 125.5 \pm 0.2_{\text{stat}} \pm 0.6_{\text{sys}} \text{ GeV}$$

And since then (2013)

Phys. Rev. D 90 (2014) 052004

$\mu = 1.30 \pm 0.18$ [ATLAS]

$\mu = 1.00 \pm 0.13$ [CMS]

112

Which Higgs boson we have discovered?

Higgs boson was discovered in ZZ^* , $\gamma\gamma$ and WW^* decays

- Higgs boson mass is ~ 125.6 GeV

Measured in $H \rightarrow ZZ^* \rightarrow 4l$ and $H \rightarrow \gamma\gamma$

ATLAS: $m_H = 125.5 \pm 0.2$ (stat) ± 0.6 (syst) GeV

CMS: $m_H = 125.7 \pm 0.3$ (stat) ± 0.3 (syst) GeV

- ATLAS and CMS data strongly favour $J^P = 0^+$ SM quantum numbers; alternative models excluded at 95% CL.
- Signal strength $\mu = \sigma/\sigma_{SM}$ consistent with 1

Summer 2013:

All measured properties are compatible with SM hypothesis.

Entrance of the Higgs into PDG

H^0 (Higgs Boson)

NODE=S055210

NODE=S055210

The observed signal is called a Higgs Boson in the following, although its detailed properties and in particular the role that the new particle plays in the context of electroweak symmetry breaking need to be further clarified. The signal was discovered in searches for a Standard Model (SM)-like Higgs. See the following section for mass limits obtained from those searches.

1 strona

Standard Model measurements

- Excellent agreement between measurements and SM prediction!
✓ Very few tensions...
- More precise measurements of W and t mass needed: indirect constrain are now better!

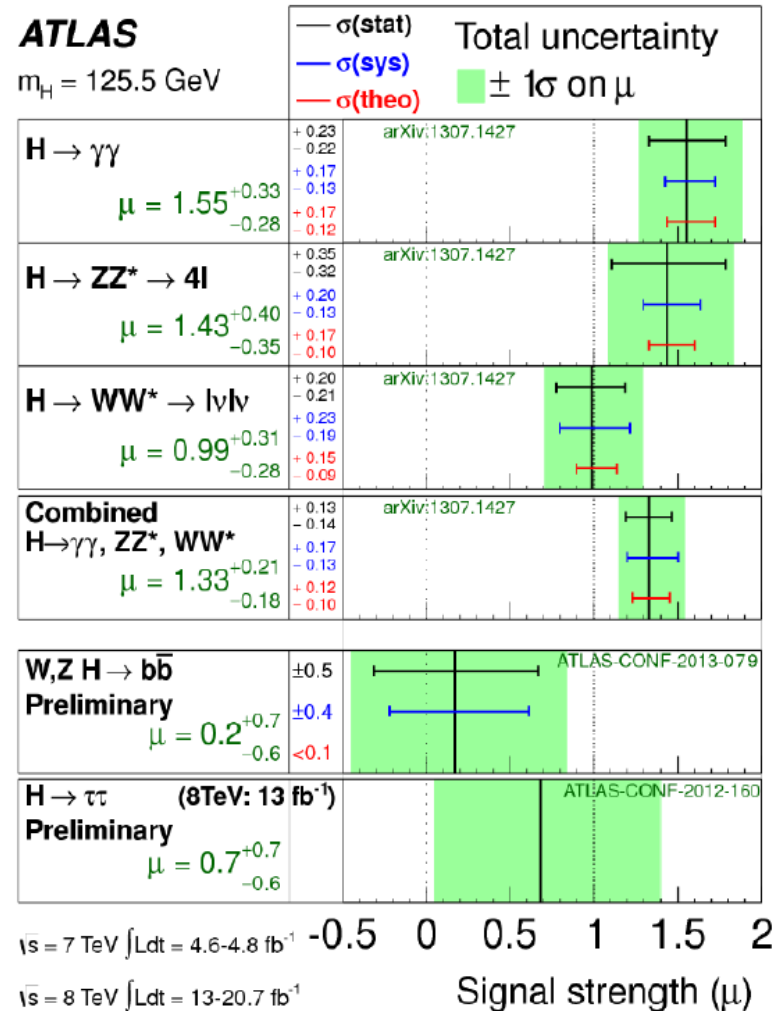

Higgs boson signal strength

$$\mu = \sigma / \sigma_{SM}$$

Individual channels are consistent

SM describes the rates well, so far

More detailed studies have been done of coupling constraints which can be derived, including on new processes in the loops

Higgs decays to fermions (2014)

CMS: $H \rightarrow \tau\tau, bb$ Channels

Significance	Exp	Obs
CMS ($\tau\tau$)	3.4σ	3.2σ
CMS (bb)	2.1σ	2.1σ

ATLAS: $H \rightarrow \tau\tau$ Channel

Significance	Exp	Obs
ATLAS ($\tau\tau$)	3.2σ	4.1σ

Tevatron: exp (2.1σ), obs (3.0σ)

What spin do particles have?

boson

Spin 0

fermions

Spin 1/2

bosons

Spin 1

What can a spin 0 particle decay to?

What can a spin 1 particle decay to?

What can a spin 2 particle decay to?

$$\textcircled{2} = \textcircled{1}^{\uparrow} + \textcircled{1}^{\uparrow} \quad \left. \vphantom{\textcircled{2}} \right\} \text{photons}$$

$$\textcircled{2} \neq \textcircled{\frac{1}{2}} + \textcircled{\frac{1}{2}} \quad \left. \vphantom{\textcircled{2}} \right\} \text{fermions}$$

$$\textcircled{2} = \textcircled{1}^{\uparrow} + \textcircled{1}^{\uparrow} \quad \left. \vphantom{\textcircled{2}} \right\} \text{W, Z bosons}$$

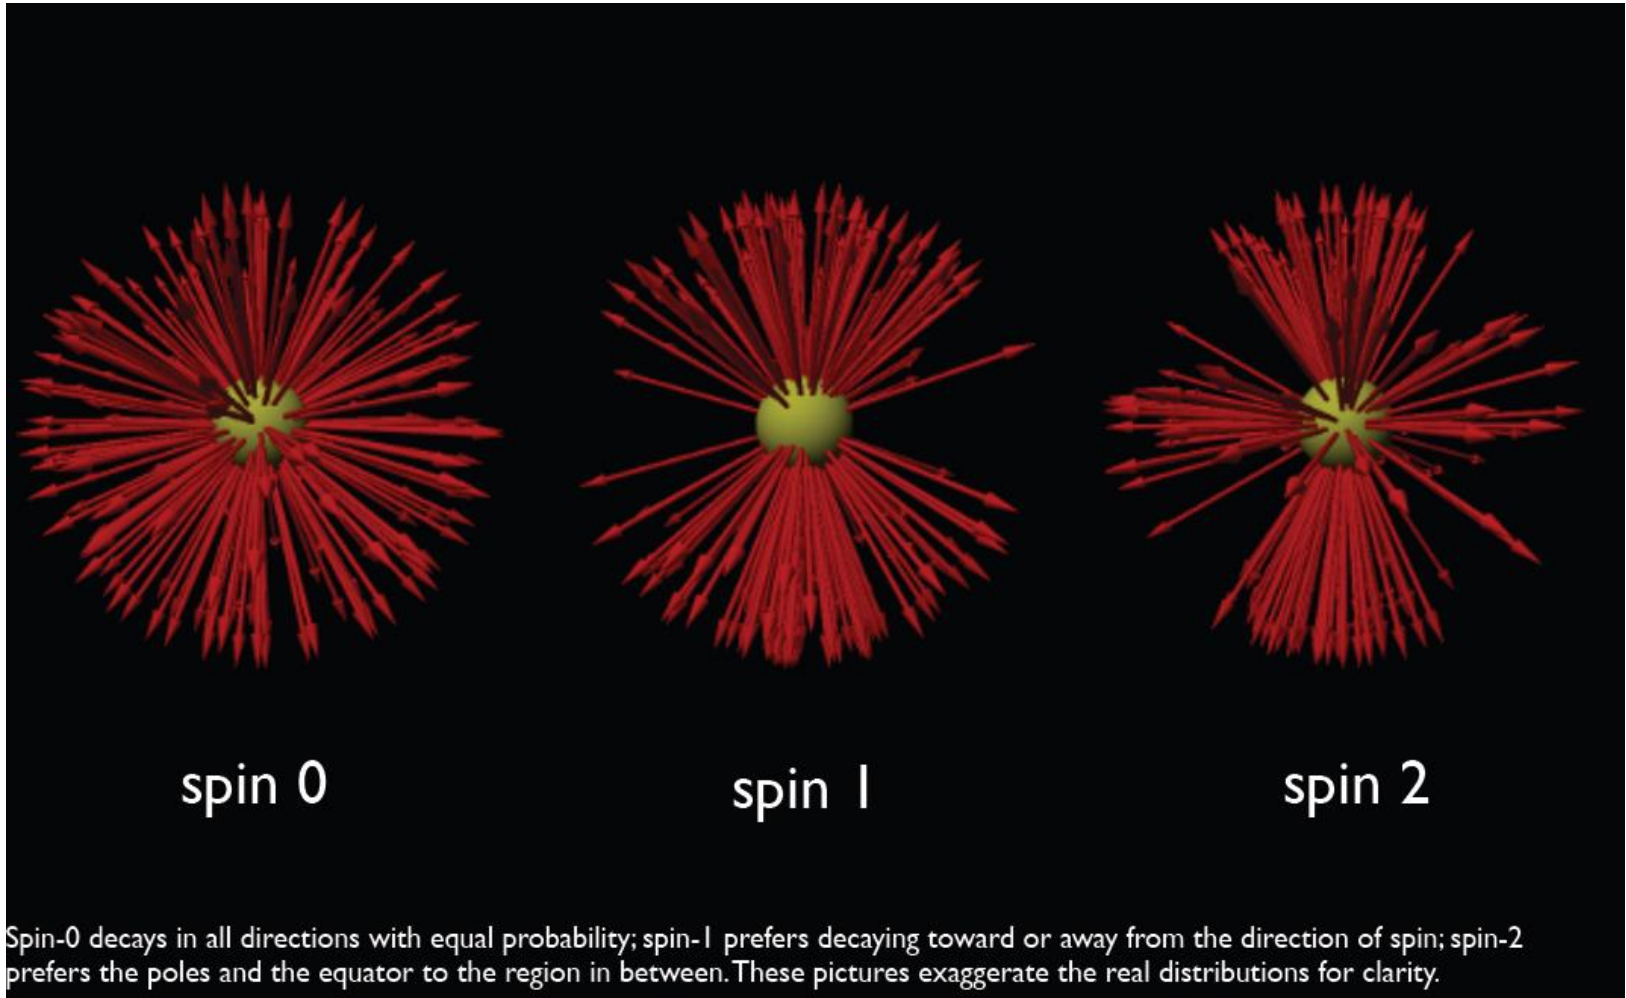

$$\textcircled{2} = \textcircled{\frac{1}{2}}^{\uparrow} + \textcircled{\frac{1}{2}}^{\uparrow} + \textcircled{1}^{\uparrow} \quad \left. \vphantom{\textcircled{2}} \right\} \text{b quarks+gluon}$$

$$\textcircled{2} \neq \textcircled{\frac{1}{2}} + \textcircled{\frac{1}{2}} \quad \left. \vphantom{\textcircled{2}} \right\} \tau \text{ leptons}$$

So what spin has Higgs-like particle?

Spin of particle	$\gamma\gamma$	ZZ^*
Spin 0		
Spin 1		
Spin 2		

How we can recognize spin?

Spin study with $H \rightarrow \gamma\gamma$

$\gamma\gamma$ polar angle θ^*
with respect to Z -axis
in Colin-Sopper frame

$$\cos \theta^* = \frac{\sinh(\eta_{\gamma_1} - \eta_{\gamma_2})}{\sqrt{1 + (p_T^{\gamma\gamma}/m_{\gamma\gamma})^2}} \cdot \frac{2p_T^{\gamma_1} p_T^{\gamma_2}}{m_{\gamma\gamma}^2}$$

- If spin-2 resonance is produced 100% by gluon fusion, observed **rejection p-values** are:
 - ✓ spin-0 \rightarrow **58.8%** (1.2% expected) \rightarrow good agreement with spin-0 hypothesis
 - ✓ spin-2 \rightarrow **0.3%** (0.5% expected) \rightarrow **spin-2 excluded at 99.3% CL**

Spin study with $H \rightarrow 4l$

- Sensitive variables

- ✓ Intermediate boson masses: m_{Z_1}, m_{Z_2}
- ✓ Z_1 production angle: θ^*
- ✓ Z_1 decay plane angle: Φ_1
- ✓ Angle between the Z_1 and Z_2 decay planes: Φ
- ✓ Decay angles of negative leptons: θ_1, θ_2

- Expected separation $> 2.5 \sigma$, except for $2+m$ ($\sim 1.5 \sigma$)

- ✓ New boson compatible with SM $0+$ Higgs hypothesis when compared pair-wise with $0-, 1-, 1+, 2+m$

Higgs boson couplings

$$g_{Hff} = m_f/v$$

$$g_{HHVV} = 2M_V^2/v^2$$

$$g_{HVV} = 2M_V^2/v$$

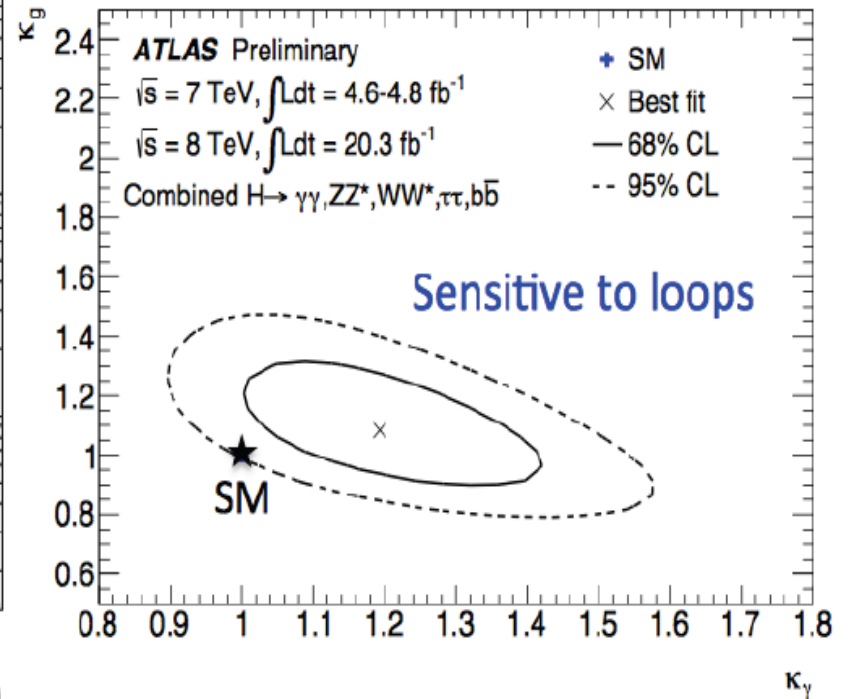

$$g_{HHH} = 3M_H^2/v$$

For the time being only
test the bosonic and
fermionic sector

$$g_{HHHH} = 3M_H^2/v^2$$

Higgs boson couplings

Higgs boson couplings

- **Simplified framework** (LO –like):

- Signals originate from single resonance with mass ~ 125 GeV
- The width of the assumed Higgs boson is neglected, i.e. zero-width approximation is used

$$(\sigma \cdot \text{BR}) (ii \rightarrow \text{H} \rightarrow ff) = \frac{\sigma_{ii} \cdot \Gamma_{ff}}{\Gamma_{\text{H}}}$$

- **Only modifications of coupling strengths are considered**, the tensor structure is assumed as in the SM i.e. assume that it is „Higgs-like” resonance.
- **Couplings represent pseudo-observables**, i.e. are not measured directly, certain „unfolding” procedure required to extract information

Measuring Higgs boson couplings

Rather than discussing couplings, introduce concept of „scale factors” κ_i : cross-section or partial width scale with κ_i^2

$$\begin{aligned} \mathcal{L} = & \kappa_3 \frac{m_H^2}{2v} H^3 + \kappa_Z \frac{m_Z^2}{v} Z_\mu Z^\mu H + \kappa_W \frac{2m_W^2}{v} W_\mu^+ W^{-\mu} H \\ & + \kappa_g \frac{\alpha_s}{12\pi v} G_{\mu\nu}^a G^{\mu\nu} H + \kappa_\gamma \frac{\alpha}{2\pi v} A_{\mu\nu} A^{\mu\nu} H + \kappa_{Z\gamma} \frac{\alpha}{\pi v} A_{\mu\nu} Z^{\mu\nu} H \\ & + \kappa_{VV} \frac{\alpha}{2\pi v} (\cos^2 \theta_W Z_{\mu\nu} Z^{\mu\nu} + 2W_{\mu\nu}^+ W^{-\mu\nu}) H \\ & - \left(\kappa_t \sum_{f=u,c,t} \frac{m_f}{v} f\bar{f} + \kappa_b \sum_{f=d,s,b} \frac{m_f}{v} f\bar{f} + \kappa_\tau \sum_{f=e,\mu,\tau} \frac{m_f}{v} f\bar{f} \right) H. \end{aligned}$$

Define the normalized coupling constants (w.r.t. the SM couplings)

$$k_i^2 = \frac{\Gamma_i}{\Gamma_I^{SM}} \quad k_H^2 = \frac{\sum k_j^2 \Gamma_j^{SM}}{\Gamma_H^{SM}}$$

Cpuplings scale factors

(I) Tree Level Couplings scale factors **w.r.t. SM**

Affecting decay and production modes

Couplings scale factors

(II) Scale factors of loop induced couplings w.r.t. SM

- Loop expression ambiguity :

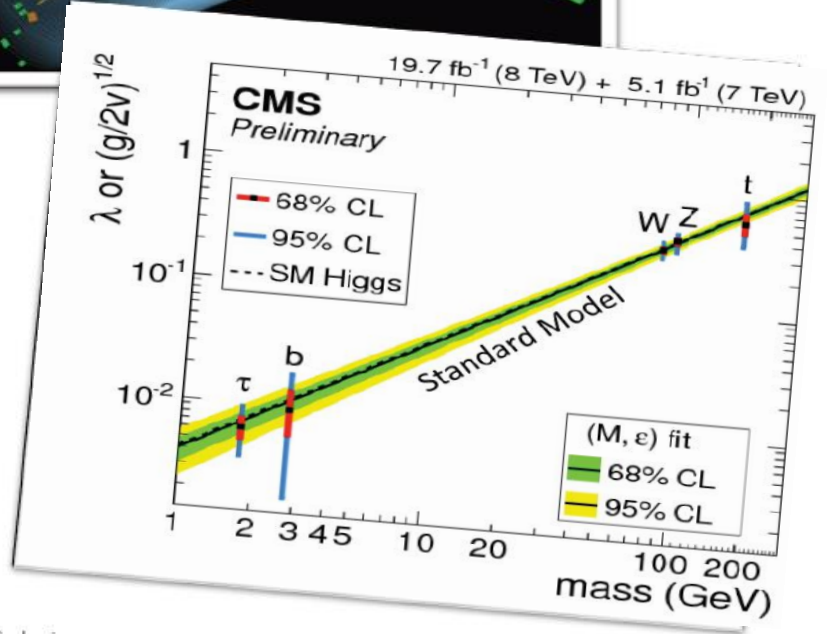

- Can be expressed in terms of k_F and k_V (Assuming the SM field content)
- Or treated effectively (Allowing for possible additional particles)

$$\kappa_g^2(\kappa_b, \kappa_t, m_H) = \frac{\kappa_t^2 \cdot \sigma_{ggH}^{tt}(m_H) + \kappa_b^2 \cdot \sigma_{ggH}^{bb}(m_H) + \kappa_t \kappa_b \cdot \sigma_{ggH}^{tb}(m_H)}{\sigma_{ggH}^{tt}(m_H) + \sigma_{ggH}^{bb}(m_H) + \sigma_{ggH}^{tb}(m_H)}$$

$$\kappa_\gamma^2(\kappa_b, \kappa_t, \kappa_\tau, \kappa_W, m_H) = \frac{\sum_{i,j} \kappa_i \kappa_j \cdot \Gamma_{\gamma\gamma}^{ij}(m_H)}{\sum_{i,j} \Gamma_{\gamma\gamma}^{ij}(m_H)}$$

Experiment = probing theories with data

(experimental) LHC physics

What do we measure?

We measure event yields

We want to derive couplings and signal strengths

The first thing we want to measure is the the "signal strength" per channel

The analysis is using discriminators (usually reconstructed mass related) to increase S/B

$$n_s^i = \mu^i \times \sum_p (\sigma^p \times Br^i)_{SM} \times A_p^i \times \epsilon_p^i \times Lumi$$

$p \in (ggF, VBF, VH, ttH)$ $i \in (\gamma\gamma, ZZ, WW, bb, \tau\tau)$

$$\mu^{ZZ}(@125.5 \text{ GeV}) = 1.44^{+0.40}_{-0.35}$$

6.6 σ (4.4 exp) ATLAS

$$\mu^{ZZ}(@125.6 \text{ GeV}) = 0.93^{+0.26+0.13}_{-0.23-0.09}$$

6.8 σ (6.7 exp) CMS

What do we measure?

We measure event yields

We want to derive couplings and signal strengths

The first thing we want to measure is the the "signal strength" per channel

The analysis is using discriminators (usually reconstructed mass related) to increase S/B

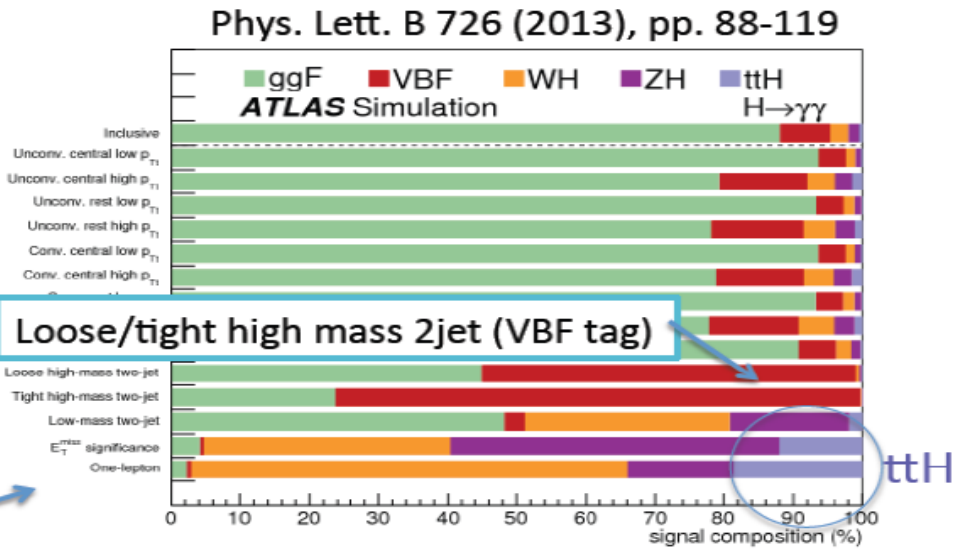

$$n_s^i = \mu^i \times \sum_p (\sigma^p \times Br^i)_{SM} \times A_p^i \times \epsilon_p^i \times Lumi$$

$p \in (ggF, VBF, VH, ttH) \quad i \in (\gamma\gamma, ZZ, WW, bb, \tau\tau)$

What do we measure?

We increase sensitivity by classifying the events via categories and measure the signal strength per category and then combining them taking all the systematic and statistical errors uncertainties into account

The categories are also sensitive to different production modes, allowing the measurement of the couplings

$$n_s^{c,i} = \mu^i \times \sum_p (\sigma^p \times Br^i)_{SM} \times A_p^{c,i} \times \epsilon_p^{c,i} \times Lumi$$

$p \in (ggF, VBF, VH, ttH)$ $i \in (\gamma\gamma, ZZ, WW, bb, \tau\tau)$

$$\mu^{\gamma\gamma}(@125.5 \text{ GeV}) = 1.57^{+0.33}_{-0.28} \quad 7.4\sigma \text{ (4.3 exp) ATLAS}$$

$$\mu^{\gamma\gamma}(@125.7 \text{ GeV}) = 0.77^{+0.29}_{-0.26} \quad 3.2\sigma \text{ (3.9 exp) CMS}$$

Probe the production mode

We fitted

$$\mu_{VBF+VH}^i \equiv \left[\mu_{VBF+VH} \times \mu_{BR}^i \right]$$

$$\mu_{ggF+ttH}^i \equiv \left[\mu_{ggF+ttH} \times \mu_{BR}^i \right]$$

Taking one decay mode at a time we can go one step further and fit the ratio per channel

$$\frac{\mu_{VBF+VH}^i}{\mu_{ggF+ttH}^i} = \frac{\mu_{VBF+VH}}{\mu_{ggF+ttH}}$$

This ratio is INDEPENDENT of the decay channel so we can combine

ATLAS Preliminary

$m_H = 125.5 \text{ GeV}$

Total uncertainty

■ $\pm 1\sigma$ on $\frac{\mu_{VBF+VH}}{\mu_{ggF+ttH}}$

Probe the production mode

Combination of two experiments

(ATLAS-CONF-2015-044, CMS-PAS-HIG-15-002)

By fitted production mode arXiv:1507.04548 [hep-ex]

The global signal strength

- Assuming SM ratios of production cross-sections and decay rates

$$\mu = 1.09^{+0.11}_{-0.10}$$

Most precise result at the expense of the largest assumptions

$$= 1.09^{+0.07}_{-0.07} \text{ (stat)} \quad ^{+0.04}_{-0.04} \text{ (expt)} \quad ^{+0.03}_{-0.03} \text{ (thbgd)} \quad ^{+0.07}_{-0.06} \text{ (thsig)}$$

*Stat and Th.Sig of comparable size
(Th.Sig dominated by ggF cross-section uncertainty)*
