What's the problem?

- $\Lambda > 0$ is physical fact!
 - \mathcal{I}^+ is spacelike
 - No universal structure on \mathcal{I}^+
 - Asymptotic symmetries: $Diff(\mathcal{I}^+)$ no distinguished generators!

Can we measure differences using GW astronomy?

Definition

A physical spacetime is (M,g) and we change it to (\tilde{M},\tilde{g}) where

$$\begin{split} \tilde{g} &= \Omega^2 g \\ \tilde{M} &= M \cup \mathcal{I} \\ \Omega|_{\mathcal{I}} &= 0 \\ d\Omega|_{\mathcal{I}} &\neq 0. \end{split} \tag{1}$$

3

DQC

Definition

A physical spacetime is (M,g) and we change it to (\tilde{M},\tilde{g}) where

$$\begin{split} \widetilde{g} &= \Omega^2 g \ \widetilde{M} &= M \cup \mathcal{I} \ \Omega|_{\mathcal{I}} &= 0 \ d\Omega|_{\mathcal{I}}
eq 0. \end{split}$$

Moreover, we assume that g satisfies Einstein equations

$$R_{ab} - \frac{1}{R}g_{ab} + \Lambda g_{ab} = 8\pi T_{ab}$$
⁽²⁾

with such asymptotics that $\Omega^{-1}T_{ab}$ is smooth up to \mathcal{I} .

This definition allows us to show that:

- $\bullet \ \mathcal{I}$ is spacelike surface
- Weyl tensor vanishes on ${\cal I}$ (which does not imply any sort of conformal flatness!)

Ξ

イロト イボト イヨト イヨト

Consequences

This definition allows us to show that:

- \mathcal{I} is spacelike surface
- Weyl tensor vanishes on \mathcal{I} (which does not imply any sort of conformal flatness!)

What is not specified:

 \bullet topology of ${\mathcal I}$

3

Example I - de Sitter

Let
$$\ell = \sqrt{\frac{3}{\Lambda}}$$
. The de Sitter metric reads

$$g = -d au^2 + \ell^2 \cosh^2\left(rac{ au}{\ell}
ight) q_{S^3}$$

王

900

◆□▶ ◆□▶ ◆三▶ ◆三▶

(3)

Example I - de Sitter

Let
$$\ell = \sqrt{\frac{3}{\Lambda}}$$
. The de Sitter metric reads
 $g = -d\tau^2 + \ell^2 \cosh^2\left(\frac{\tau}{\ell}\right) q_{S^3}$ (3)

Taking $\Omega = \cosh^{-1}\left(\frac{\tau}{\ell}\right)$, one can see that a metric induced is simply $\ell^2 q_{S^3}$ and $\mathcal{I} = S^3$.

990

イロト 不得下 イヨト イヨト 二日

Example II - k = 0 cosmology

Let us consider

$$g = a^{2}(\eta) \left(d\eta^{2} + q_{\mathbb{R}^{3}} \right)$$
(4)

with a determined by Friedmann equations with Λ and a reasonable matter content (say, dust and radiation). Then, we can take $\Omega = a^{-1}$, metric induced on \mathcal{I} is simply $q_{\mathbb{R}^3}$ and $\mathcal{I} = \mathbb{R}^3 = S^3 \setminus \{p\}$. If there is any matter, we cannot choose different Ω to enlarge \mathcal{I} to S^3 .

Example III - Kottler black hole

Let us consider

$$g = -\left(1 - \frac{\Lambda r^2}{3} - \frac{2M}{r}\right) du^2 - 2dudr + r^2 \mathring{\gamma}_{AB} dx^A dx^B.$$
 (5)

This metric describes Schwarzschild-like BH, it satisfies A-Einstein equations. Taking $\Omega = r^{-1}$ we see that it is asymptotically de Sitter. In this case $\mathcal{I} = \mathbb{R} \times S^2 = S^3 \setminus \{p_1, p_2\}$ and the induced metric is

$$q = \frac{\Lambda}{3} du^2 + \gamma_{AB} dx^A dx^B. \tag{6}$$

Example III - Kottler black hole

Let us consider

$$g = -\left(1 - \frac{\Lambda r^2}{3} - \frac{2M}{r}\right) du^2 - 2dudr + r^2 \mathring{\gamma}_{AB} dx^A dx^B.$$
 (5)

Behaviour near ${\mathcal I}$

We use Fefferman-Graham gauge

$$ds^{2} = -\frac{3}{\Lambda} \frac{d\rho^{2}}{\rho^{2}} + \gamma_{ab}(\rho, x^{c}) dx^{a} dx^{b}$$
⁽⁷⁾

where $\gamma_{\textit{ab}}$ has an expansion

$$\gamma_{ab} = \rho^{-2} g_{ab}^{(0)} + \rho^{-1} g_{ab}^{(1)} + g_{ab}^{(2)} + \rho g_{ab}^{(3)} + O(\rho^2).$$
(8)

 $g_{ab}^{(1)}$ and $g_{ab}^{(2)}$ are determined by $g_{ab}^{(0)}$ and Einstein equations, $g_{ab}^{(3)}$ is freely prescribed up to the constraints

$$g^{(0)ab}g^{(3)}_{ab} = 0 (9)$$

$$D^{(0)a}g^{(3)}_{ab} = 0. (10)$$

For convenience let us write

$$T_{ab} = \frac{\sqrt{3\Lambda}}{16\pi G} g_{ab}^{(3)}.$$
 (11)

Initial data

Such $g^{(0)}$ and T_{ab} are defined up to conformal transformations:

$$(g^{(0)}, T) \sim (\Omega^2 g^{(0)}, \Omega^{-1} T).$$
 (12)

From the work of Friedrich it follows that $[(g^{(0)}, T)]$ uniquely defines solution (at least in some neighborhood of de Sitter). In the Fefferman-Graham gauge, all $g^{(n)}$ with n > 3 satisfy recurrence equations which express them unambiguously in terms of $(g^{(0)}, T)$.

Physics at the boundaries

In practice $\delta\Sigma$ is a cross-section of ${\mathcal I}$ so let us denote

$$\lim_{\to \mathcal{I}^+} \omega = \overline{\omega} \tag{15}$$

and let Θ be such that

$$\overline{\omega}(\phi;\delta_1\phi,\delta_2\phi) = 2\delta_{[1}\Theta(\phi;\delta_{2]}\phi).$$
(16)

Then, a 'correct' Hamiltonian is given by

$$\delta H_{\xi} = \int_{\partial \Sigma} \left(\delta Q - \xi \cdot \theta \right) + \int_{\partial \Sigma} \xi \cdot \Theta$$
 (17)

and $F_{\xi} = \Theta(\phi, \mathcal{L}_{\xi}\phi).$

The only such term is $g^{ab}T_{ab}$ which happens to be zero. Notice that analytical properties are of importance here. Otherwise, we could take for example

$$w = \sqrt{C^{abc} C_{abc}},\tag{23}$$

where C_{abc} is a Cotton tensor of $g^{(0)}$.

23/1

Problem

It follows that all diffeomorphism of $\mathcal I$ are asymptotic symmetries (in contrast to e.g. AF spacetimes). Our prescription thus generates way too many charges with non-zero fluxes even on 'stationary' solutions! However, constraint

$$D^a T_{ab} = 0 \tag{24}$$

shows that at least some of those are gauge transformations. It can be shown [Ashtekar 2016] that the quotient is actually de Sitter! (At least when $\mathcal{I} \sim \mathbb{R} \times S^2$.)

Problem

shows that at least some of those are gauge transformations. It can be shown [Ashtekar 2016] that the quotient is actually de Sitter! (At least when $\mathcal{I} \sim \mathbb{R} \times S^2$.)

Q: Can we actually distinguish de Sitter algebra within $\Gamma(T\mathcal{I})$?

24/1

Minimal surfaces

The idea (geometrical idea, physical content is not yet clear) is to introduce a frame in which the induced metric reads [Compère, Fiorucci, Ruzziconi 2019]

$$g^{(0)} = du^2 + q_{AB}dx^A dx^B \tag{25}$$

and det $q = q(x^A)$ is fixed. In AF spacetime context, equivalent condition is well-known [Kijowski 1984]. It follows from [Chruściel 1985] that if $[g^{(0)}]$ becomes conformally flat quickly enough, such a frame exists and is in fact unique. Then, we can propagate de Sitter algebra from $u \to -\infty$ to the whole \mathcal{I} using a vector field ∂_u .

イロト イボト イヨト イヨト

Then, we can propagate de Sitter algebra from $u \to -\infty$ to the whole \mathcal{I} using a vector field ∂_{μ} .

Q: What is the physical meaning of this? What kind of initial and final conditions are allowed?

25/1

de Sitter and Schwarzschild-de Sitter

We can use Killing vectors of the de Sitter to calculate charges and fluxes of perturbations of dS. In particular, energy flux reads:

$$\mathbf{F}_{\partial_{u}} = \frac{1}{16\pi H} \mathcal{E}_{cd} \mathcal{L}_{\partial_{u}} g_{ab}^{(0)} \mathring{g}^{(0)ac} \mathring{g}^{(0)bd} \sqrt{\mathring{g}^{(0)}} d^{3}x, \qquad (26)$$

which coincides with the results from the linearized theory [Chruściel, Hoque, Smołka 2020; MK, Lewandowski 2020] and have the correct limit as $\Lambda \rightarrow 0$. We can similarly treat perturbations around the Schwarzschild-de Sitter because we have distinguished rotations generators and 'time'-translation generator (up to a scale) among Killing vectors.

Funnily enough, waves with only magnetic part have no zero energy density (which integrates to zero, though).

26/1

Kerr-de Sitter

We have 2dim space of Killing vectors: $\operatorname{span}\{\partial_t, \partial_\phi\}$. Angular momentum is defined uniquely by the requirement that generator's orbits are closed with a period 2π – it is ∂_{ϕ} . Having that, energy generator T is picked up as being perpendicular to ∂_{ϕ} : $T = \partial_u + a(a^2 + l^2)^{-1}\partial_{\phi}$. Question: is there any physical reason to choose this T?

Kerr-de Sitter

We have 2dim space of Killing vectors: $\operatorname{span}\{\partial_t, \partial_\phi\}$. Angular momentum is defined uniquely by the requirement that generator's orbits are closed with a period 2π – it is ∂_{ϕ} . Having that, energy generator T is picked up as being perpendicular to ∂_{ϕ} : $T = \partial_u + a(a^2 + l^2)^{-1}\partial_{\phi}$. Question: is there any physical reason to choose this T? How to extend this choice far away from the Kerr-de Sitter?
